DEFINITION OF TERMS

The following terms and concepts were used in this report and were defined as follows:

ADJUSTED OR STANDARDIZED RATES - To render the rates of 2 communities comparable, adjustment for the difference in age, sex, race and any other factors which influence vital events have to be made.

2 methods:

- a) By applying observed specific rates to some standard population
- b) By applying specific rates of standard population to corresponding classes or groups of the local population.

ATTACK RATE (AR) - A more accurate measure of the risk of exposure. Useful in epidemiological investigations

ATTENDED - refers to the cases given medical care at any point in time during the course of the illness which directly caused death. Medical care may either be provided directly by a medical doctor or indirectly by allied health care providers, i.e., nurses and midwives who are under the direct supervision of a medical doctor. Otherwise, case is categorized as “**death unattended**” .

BIRTH ORDER – is the numerical order of a child in relation to all previous pregnancies of the mother.

BIRTH WEIGHT - is the first weight of the fetus or newborn obtained after birth.

CRUDE BIRTH RATE (CBR) - is a measure of one characteristic of the natural growth or increase of a population.

CRUDE DEATH RATE (CDR) – is measure of one mortality from all causes which may result in a decrease of population.

CRUDE or GENERAL RATES - These rates are referred to the total living population. It must be presumed that the total population was exposed to the risk of the occurrence of the event.

DEATH – is the permanent disappearance of all evidence of life at any time after live birth has taken place (postnatal cessation of vital functions without capability of resuscitation).

FETAL DEATH – is the death prior to the complete expulsion or extraction of a product of conception from its mother, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

FETAL DEATH RATE (FDR) - Measures pregnancy wastage. Death of the product of conception prior to its complete expulsion, irrespective of duration of pregnancy.

INCIDENCE RATE (IR) - Measures the frequency of occurrence of the phenomenon during a given period of time. Deals only with new cases.

INFANT MORTALITY/DEATH – is the death of an infant under one year of age.

INFANT MORTALITY RATE (IMR) - Measures the risk of dying during the 1st year of life. It is a good index of the general health condition of a community since it reflects the changes in the environmental and medical conditions of a community.

LATE FETAL DEATH – is the death of fetus with 28 or more completed weeks of gestation.

LIVE BIRTH – is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy, which after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached; each product of such birth is considered liveborn.

MATERNAL MORTALITY/DEATH – is the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and the site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management, but not from accidental or incidental causes.

MATERNAL MORTALITY RATE (MMR) - It measures the risk of dying from causes related to pregnancy, childbirth and puerperium. It is an index of the obstetrical care needed and received by the women in a community.

NEONATAL DEATH – is the death among live births during the first 28 completed days of life.

NEONATAL DEATH RATE (NDR) - Measures the risk of dying during the 1st month of life. May serve as index of the effects of prenatal care and obstetrical management on the newborn.

PLACE OF OCCURRENCE - refers to the place where the vital event took place.

PREVALENCE RATE (PR) - Measures the proportion of the population which exhibits a particular disease at a particular time. This can only be determined following a survey of the population concerned. Deals with total (old and new) number of cases.

PROPORTIONATE MORTALITY (PM) - Shows the numerical relationship between deaths from a cause (or groups of causes), age (or groups of age) etc. and the total number of deaths from all causes in all ages taken together. Not a measure of risk of dying.

RATE - In Vital Statistics, a rate shows the relationship between a vital event and those persons exposed to the occurrence of said event, within a given area and during a specified unit of time. It is evident that the persons experiencing the event (the numerator) must come from the total population exposed to the risk of same event (the denominator).

RATIO - It is used to describe the relationship between two (2) numerical quantities or measures of events without taking particular considerations to the time or place. These quantities need not necessarily represent the same entities, although the unit of measure must be the same for both numerator and denominator of the ratio.

SPECIFIC DEATH RATE - Describes more accurately the risk of exposure of certain classes or groups to particular diseases. To understand the forces of mortality, the rates should be made specific provided the data are available for both the population and the event in their specifications. Specific rates render more comparable results and thus, reveal the problems of public health.

SPECIFIC RATE - The relationship is for a specific population class or group. It limits the occurrence of the event to that portion of the population definitely exposed to it.

TOTAL FERTILITY RATE (TFR) – refers to the number of children a woman would have by the time she reaches age 50 under a given fixed fertility schedule. It is sometimes referred to as completed family size. It is the average number of births per 100 females aged 15-49 years.

USUAL RESIDENCE – refers to the place where the person/deceased habitually or permanently resides.

FORMULA OF VITAL HEALTH INDICATORS

Attack Rate (AR)

$$AR = \frac{\text{No. of persons acquiring a disease registered in a given year}}{\text{No. exposed to same disease in same year}} \times 100$$

Case Fatality Ratio(CFR)

$$CFR = \frac{\text{No. of registered deaths from a specific disease for a given year}}{\text{No. of registered cases from same specific disease in same year}} \times 100$$

Crude Birth Rate (CBR)

$$CBR = \frac{\text{Total No. of live births registered in a given calendar year}}{\text{Estimated population as of July 1 of same year}} \times 1,000$$

Crude Death Rate (CDR)

$$CDR = \frac{\text{Total no. of deaths registered in a given calendar year}}{\text{Estimated population as of July 1 of same year}} \times 1,000$$

Fetal Death Ratio

$$FDR = \frac{\text{Total no. of fetal deaths registered in a given calendar year}}{\text{Total no. of live births registered of same year}} \times 1,000$$

Fetal Death Rate

$$\text{FDR} = \frac{\text{Total no. of fetal deaths registered in a given calendar year}}{\text{Total no. of births (livebirths and fetal deaths) registered of same year}} \times 1,000$$

Incidence Rate (IR)

$$\text{IR} = \frac{\text{No. of new cases of a particular disease registered during a specified period of time}}{\text{Population at risk}} \times 100,000$$

Infant Mortality Rate (IMR)

$$\text{IMR} = \frac{\text{Total no. of deaths under 1 year of age registered in a given calendar year}}{\text{Total no. of registered live births of same calendar year}} \times 1,000$$

Maternal Mortality Ratio (MMR)

$$\text{MMR} = \frac{\text{Total no. of deaths from maternal causes registered for a given year}}{\text{Total no. of live births registered of same year}} \times 1,000$$

Maternal Mortality Rate (MMR)

$$\text{MMR} = \frac{\text{Total no. of deaths from maternal causes registered for a given year}}{\text{Total no. of women under reproductive age}} \times 1,000$$

Neonatal Death Rate (NDR)

$$\text{NDR} = \frac{\text{No. of deaths under 28 days of age registered in a given calendar year}}{\text{No. of live births registered of same year}} \times 1,000$$

Prevalence Rate (PR)

$$\text{P R} = \frac{\text{No. of new and old cases of a certain disease registered at a given time}}{\text{Total no. of persons examined at same given time}} \times 100$$

Proportionate Mortality (PM)

$$\text{P M} = \frac{\text{No. of registered deaths from a specific cause or age for a given calendar year}}{\text{No. of registered deaths from all causes, all ages in same year}} \times 100$$

Specific Death Rate (SDR)

$$\text{Specific Death Rate} = \frac{\text{Deaths in specific class or group registered in a given calendar year}}{\text{Estimated population as of July 1 in same specified class or group of said year}} \times 100,000$$

Examples:

$$\text{Cause-specific Death Rate} = \frac{\text{No. of deaths from a specific cause registered in a given calendar year}}{\text{Estimated population as of July 1st of same year}} \times 100,000$$

$$\text{Age-specific Death Rate} = \frac{\text{No. of deaths in a particular age group registered in a given calendar year}}{\text{Estimated population as of July 1st in same age group of same year}} \times 100,000$$

$$\text{Sex-specific Death Rate} = \frac{\text{No. of deaths of a certain sex registered in a given calendar year}}{\text{Estimated population as of July 1 in same sex for same year}} \times 100,000$$

INTRODUCTION

The *Philippine Health Statistics (PHS)* series is the Department of Health's (DOH) annual publication that compiles statistics on vital health events. It provides comprehensive summary of the country's current statistics on Natality, Morbidity and Mortality.

The *PHS* is a product of the collaborative and coordinated efforts of the Philippine Statistics Authority (PSA), this Department and our partners from the local health units. The statistical data on births, deaths and population estimates were provided by the PSA and data on notifiable diseases were collected through the DOH's Field Health Service Information System (FHSIS). The data from these two sources were summarized, analyzed, interpreted and presented in tables and graphs for a more meaningful and useful information.

In addition, morbidity and notifiable diseases data were incorporated to give a comprehensive comparison between morbidity and mortality statistics

The *PHS* is intended to serve as one of the bases of health administrators at various levels of health sectors for planning, implementation and assessment of health programs and services. These data can also be utilized to assess costs of health care, develop and improve health interventions, or identify targets for health programs. These are also important tools not only for planning but also for monitoring and evaluation of health programs. Likewise, statistical data in this publication can also be beneficial to the researchers, academicians and local government executives.

The Department of Health (DOH) through the Epidemiology Bureau (EB), as an advocate for evidence-based decision making at all levels of the public health systems, believes that vital health statistics provide some measures of progress of the nation, thus, the *2014 Philippine Health Statistics* is hereby presented

A. SOURCES OF DATA

1. *Natality and Mortality Statistics*

Effective March 1973 a collaborative program was drawn with the National Statistics Office (NSO), now known as PSA as per RA 10625, otherwise known as the Philippine Statistical Act of 2013, whereby that Office shall provide basic tabulation on births and deaths. Summary tables on births, deaths, infant and fetal deaths were taken from the said Office. The basis of the registration of vital events regarding births and deaths is Republic Act No. 3753 otherwise known as the Civil Registry Law. By virtue of Commonwealth Act 591, the Administrator of NSO will be the concurrently Civil Registrar-General with all local civil registrars under his supervision. In the cities, the local civil registrars are also the officials designated in their respective city charters, generally the City Health Officers, while in regular municipalities and municipal districts, the municipal treasurers and municipal district treasurers act as local civil registrar respectively. Each vital event is registered in the office of the civil registrar of the locality where the event occurred and a

copy of each document is sent to the Office of the Civil Registrar General of the PSA for processing and archiving.

Statistics were obtained from Death Certificate (Municipal Form No. 103) and Certificate of Live Birth (Municipal Form No. 102).

The Vital Statistics Division of the PSA consolidates and tabulates total counts of registered live births and deaths. Fetal and infant deaths have separate tables for deaths by cause, while, causes of maternal death were lifted from deaths by age group and by cause.

By virtue of a Memorandum of Agreement between the PSA and DOH, the former furnishes the DOH copies of summary tables of the number of live births and deaths. The latter then computes rates and percentages of different indicators significant to the needs of its various clients and stakeholders. Some tables come with graphs and textual analysis for better understanding and utilization of data.

2. Notifiable Disease Statistics

Data on Notifiable Diseases is based on information submitted by health personnel of different Rural Health Units (RHUs), City Health Offices (CHOs) or Municipal Health Offices (MHOs) and Provincial Health Offices (PHOs). The Law on Reporting of Notifiable Diseases (Act 3573) mandates the immediate reporting of any Notifiable Disease to the nearest health officer. All field health officers, by means of established reporting mechanism (Memorandum Order No. 51-a.s. 1960) submit weekly morbidity reports (Forms W1-a and W1-b) to the Epidemiology Bureau (EB) where such data received are then classified, compiled, analyzed and interpreted. The complete report is presented in Field Health Service Information System (FHSIS) Annual Report.

On July 27, 2001, a DOH Department Circular No. 176, series of 2001 was issued for a revised list of Notifiable or Reportable Diseases which now includes the ICD-10 code of each case except for Acute Watery Diarrhea and Acute Bloody Diarrhea.

3. Population Statistics

In lieu of the official census-based national, regional and provincial population projection, which is still under completion by the Inter-Agency Working Group on Population Projection (IAGPP) at the time PHS 2014 was developed, this publication adopted the DOH Department Memorandum No. 2014-0008. The memorandum states that the DOH computed population based on growth rate between census years 2000 and 2010 can be used for preparation of statistical reports for Health Sector only, pending the release of official estimated population of the PSA.

B. CLASSIFICATION OF DATA

Classification of health statistics and population statistics must be made according to the similarly defined system and tabulated in comparable groups in order to make use of the principal value of both data. Thus, variables common to both, i.e., geographic area, age and sex have been similarly classified and tabulated in this report.

1. Geographic Classification

Data on Notifiable Diseases have been classified by place of occurrence. First by region which is a geographical division created as a result of the reorganization of the Department of Health (DOH), then, by province and city that were political divisions of the country. There are seventeen (17) regions, eighty (80) provinces and one hundred twenty-one (121) cities. The National Capital Region (NCR) has one (1) more municipality which is Pateros. There is no classification as to whether it is rural or urban because of the lack of established criteria.

Natality and mortality data were classified geographically either by place of occurrence or by usual residence. Usual residence refers to the place where the person habitually or permanently resides. Data on deaths by place of usual residence of the deceased are used to prepare population estimates and projections. These data include birth or death that occurred in the Philippines and the deceased were residents of other countries which fall under classification "foreign countries". On the other hand, classification of data by place of occurrence considered the actual place in the Philippines where vital event occurred not prioritizing the usual residence of the deceased.

2. Age

There is no valid information with regard to the accuracy of age of a reported morbid case. Regarding the registered deaths, the age of deceased is fully determined by the date of birth. However, some of the vital records are submitted with the age not recorded or the date of birth not indicated. Thus, misstatement of age on vital records may be assumed to some degree. The age classification or age groupings used in this report are consistent with those recommended for international use by the World Health Organization.

3. Diseases and Causes of Death

The Mortality statistics was tabulated based on the underlying cause of death documented on the medical certificate of cause of death. The underlying cause has been defined as the disease or injury which initiated the train of

morbid events leading directly to death; or the circumstances of the accident or violence which produced the fatal injury. The selected cause of death does not include symptoms and modes of dying, such as heart failure or respiratory failure.

On the other hand, Morbidity statistics was tabulated based on the report submitted through FHSIS from the list of Notifiable Diseases. Other diseases not on the list were also reported as it occurred in the population. These were then summarized and ranked according to the number of cases per reported disease.

The Morbidity and Mortality statistics in this publication were classified and tabulated in accordance with the International Classification of Diseases, Version 10 (ICD-10). The structure of the ICD-10 code is alphanumeric. The first character of the code is an alpha character, A to Z, followed by 2, 3 or 4 numeric character. Some 3 character categories are further subdivided into sub-categories to enable coding of a disease or condition as specific as possible

4. *Sex*

Classification by sex is made in relation to other factors such as age, and geographical location. Thus, some tabulation presented in this report may be considered as four-fold tables with sex as one of the attributes of classifications.

C. ANALYSIS AND INTERPRETATION OF DATA

Vital statistics are essential in planning, operating and evaluating programs not only on health but also in some aspects too like, transport, agricultural production, employment, housing, among others. They are very useful for a variety of administrative and research purposes. However, they cannot correctly be interpreted unless pertinent qualifying factors are taken into consideration.

Some of the factors limiting the use of statistical data emanate from discrepancies in the original records or from the impracticability of tabulating these data in very detailed items. While these defects do exist, nevertheless, the value of these data for original purposes is indispensable. The exact evaluation of health statistics or the analysis of small differences necessitates careful study of a variety of related elements. However, the major trends and differences may not be altered materially by finer analysis.

1. *Small Frequencies*

The number of births and deaths reported for an area or community, or the number of ailments, represents complete counts of such events. Such being the case, they are not subject to sampling errors although they are

subject to errors in the registration process or reporting system. When data is used for analytical purposes, as for example, the comparison of rate over a time period or for different areas, the number of events that actually occurred may be considered as one of a large series of possible results that could have rise under the same circumstances. In accordance with certain statistical assumptions, the probable range of values may be estimated from the actual figures.

2. *Computation of Statistical Indices*

In the computation of statistical indices for the Philippines and each region, province and city, the standard formulae are used. Thus, the crude birth and death rates are computed per 1,000 population; the infant, neonatal and maternal death rates and fetal death ratio are per 1,000 live births; and the specific diseases morbidity and mortality rates classified either by age, sex or age and sex are computed per 100,000 population. If it is further tabulated by age, it is computed per 100,000 population of that specific age group.

3. *Completeness of Registration and Notification*

In the Philippines, although the law provides for a compulsory registration of births, deaths and fetal deaths and the reporting of Notifiable Diseases (Act 3573) there are deficiencies in the observance of the law due to a variety of factors. In the interpretation of these data, caution must be observed as the data were not adjusted for under registration or underreporting. Marked fluctuations in vital events totals for some specific areas do not necessarily reflect differentials in fertility or mortality level but rather could be indications of variations in registration coverage. In the case of notifiable diseases, sources of data are the RHUs and BHSs in the country, thus cases identified or confirmed in hospitals and other private facilities may not be included in the report unless these private practitioners submit Notifiable Diseases or report to their respective city or provincial health offices. Completeness in the reporting of notifiable diseases varies greatly by disease and by area. In general and from all indications, reporting is apparently incomplete.

Philippine Health Picture

1994- 2014

	<p><i>PROJECTED POPULATION</i> Increased from 68,624,247 to 99,874,258 46% Increase</p>
	<p><i>CRUDE BIRTH RATE</i> Decreased from 24.0 to 17.5 27% Decrease</p>
	<p><i>CRUDE DEATH RATE</i> Increased from 4.7 to 5.4 15% Increase</p>
	<p><i>INFANT DEATH RATE</i> Declined from 18.9 to 12.1 36% Decrease</p>
	<p><i>MATERNAL DEATH RATE</i> Declined from 1.1 to 0.9 18% Decrease</p>
	<p><i>FETAL DEATH RATIO</i> Declined from 5.7 to 4.4 23% Decrease</p>

Table 1

ESTIMATED POPULATION BY SEX
Philippines, 1964-2014

Year	Both Sexes	Male	Female
2014	99,874,258	50,398,082	49,476,175
2013	98,011,951	49,468,720	48,543,231
2012	96,184,369	48,556,453	47,627,916
2011	94,385,998	47,658,536	46,727,462
2010	94,013,200	47,263,600	46,749,600
2009	92,226,600	46,368,900	45,857,700

Figure 8

NATALITY STATISTICS

Birth statistics presented in this report were obtained from the Certificates of Live Birth (Municipal Form 102) transmitted by the City/Municipal Civil Registrars to the Philippine Statistics Authority (PSA). Statistics presented include only those births which occurred in 2014 and were registered from January 2014 to March 2015. Births that were registered after March 2015 and those that were not registered at all were not included in the report.

There were 1,748,857 live births registered in 2014 with corresponding Crude Birth Rate (CBR) of 17.5 live births per 1000 population. This is 0.3% decrease in last year's CBR, with a decrease of 12,745 livebirths in number. More than three babies are born alive per minute, which corresponds to a daily average of 4,791 live births. (Table 4)

Figure 4 shows a slight difference in CBR every year. An alternate increase-decrease in CBR is evident during the past five years. The average difference over a 10-year period (from 2005 to 2014) in CBR is 0.2 per thousand population. However, this difference in CBR doesn't solely depend on the increase or decrease of number of live births but it is computed against the population. We can, therefore say, that the decrease in CBR can also be attributed to the rapid increase in population.

The Central Visayas Region was highest in CBR in 2014 with 20.9 live births per thousand population. Second in rank was Bicol Region with a CBR of 20.1. It was followed by National Capital Region (NCR) (18.8) and Cordillera Administrative Region (CAR) (18.6). The Autonomous Region of Muslim Mindanao (ARMM) was still at the bottom with CBR of only 4.3. There were ten (10) regions out of 17 with CBR higher than the national rate of 18.6. (Table 5)

The month with the highest number of babies born alive was in October of 2014. There were 164,231 live births which comprised a 9.4% of total live births. The daily average of babies born alive during this month was about 5,298. The lowest birth occurrence was still in February with 120,162 live births which was 6.9% of the total live births and an average of daily live births at 4,292. (Table 6)

The country's fertility rate in 2014 was computed at 6.7. This was translated as to at least six (6) babies born alive per 100 female of reproductive age 15-49 years. Regions of Bicol (8.7) and Central Visayas (8.1) had highest fertility rates. There were six more regions which had higher fertility rates as compared to the national fertility rate. While, ARMM had the lowest with 1.7. (Table 7)

More male babies were born alive in 2014 (912,465 or 52%) than female babies (836,392 or 48%) for a sex ratio of 109 males per 100 females. This ratio means that for every 109 alive baby boys born, there correspond 100 alive baby girls born in 2014. For over a decade now, statistics show that for all live births, the number of male babies

always exceeds the number of female babies. Consistently, the estimated population revealed that Philippines was a male dominating country in terms of number.

Among the 17 regions, Zamboanga Peninsula had the highest sex ratio of 111 males per 100 females, while, NCR and CALABARZON were the lowest with 108 males per 100 females. (Table 8)

More than half (53.1%) of live births were attended by a medical doctor. About three (3) in every ten (10) babies or 32.3% of the total live births were attended by a midwife. In 2014, medically attended births (87.4%) is 2.3 percentage points higher than in 2013 (85.1%). Nine (9) out of 17 regions in the country, have more than 50% of births attended by a physician. The highest of which is CAR (78.1%); followed by the Ilocos Region (69.8%) and NCR (65.7%).

However, there is still more than one out of ten births attended by traditional birth attendants or unlicensed midwives. Overall, more than one-tenth (11.8% or 205,571) of total live births were attended by them. Across regions, ARMM (44.7%) and MIMAROPA (23.1%) were reported to consistently have the highest proportion of live births attended by hilot or unlicensed midwives. (Tables 9 and 10)

About 209,872 or 12.0% of live births were born to mothers under 20 years old. This was translated to more than one birth in every ten births were born by teenage mothers.

Almost three out of ten (28.96%) live born were from mothers belonging to age-group 20-24 years and had the most number of live births with 506,451 babies. It is closely followed by mothers of age-group 25-29 years with 436,091 live births or 24.94%. While, only 392 or 0.02% live births were born to mothers beyond reproductive age (50 years and over). (Table 11)

Across all regions, CALABARZON had the highest share on the number of live births born by women of age-group 20-24. Out of the total babies born by mothers of said age group (506,451), CALABARZON had 71,190 live births, followed by NCR with 65,306 live births. The two regions interchanged ranks for number of live births born by younger mothers, age under 15 years. Out of 1,877 babies, NCR had 339 and CALABARZON had 289 live births. (Table 13)

MORBIDITY AND NOTIFIABLE DISEASES STATISTICS

The Department of Health (DOH) mandates the reporting of the following diseases preferably within 72 hours of occurrence of the case: AIDS/HIV Infection, Bronchitis, Cholera, Chickenpox, Dengue H-Fever, Diarrheas, Diphtheria, Diseases of the Heart, Filariasis, Viral Hepatitis, Influenza, Leprosy, Malaria, Malignant Neoplasms, Measles, Pneumonias, Poliomyelitis, Schistosomiasis, Syphilis, Gonorrhea, Tetanus Neonatorum, Non-Neonatal Tetanus, Typhoid and Paratyphoid, TB Respiratory, TB Meningitis, TB other forms, Whooping Cough, Hypertension, Rabies, Meningitis, Leptospirosis, Poisoning, Meningococemia, and other diseases with unusual occurrence.

This mandatory reporting of diseases was by virtue of Republic Act 3573 or otherwise known as the Law on Reporting of Communicable Diseases.

The source of the Morbidity data presented in this report is the 2014 Field Health Service Information System (FHSIS) Annual Report. The FHSIS data were based on the weekly notifiable disease reports from Barangay Health Stations (BHSs) and Rural Health Units (RHUs). These were consolidated at the provincial/city and regional levels and then submitted to the Epidemiology Bureau (EB) for the national morbidity report. The Morbidity statistics is then published as one of the components of the FHSIS Annual Report.

The PHS presents summary tables of morbidity statistics. Morbidity rates for each morbid condition were computed per 100,000 of the national and regional population. The population used was from the DOH Department Memorandum No. 2014-0008.

The 2014 PHS presented the ten (10) leading causes of morbidity. The top five diseases reported were Acute Respiratory Infection with a total of 1,445,320 cases or a rate of 1,447.1 per 100,000 population. This is a 33.5% and 34.8% decrease in number and rate respectively, from the 2013 rate of 2,218.9 per 100,000 population with 2,174,740 cases. It was followed by Acute Lower Respiratory Tract Infection (ALRTI) and Pneumonia (488,415; 489.0), Hypertension (475,693; 476.3), Urinary Tract Infection (213,666; 213.9) and Bronchitis (204,086; 204.3). The same top three diseases were recorded last year, however, the number of cases were much lower this year as compared to 2013.

Table 15 shows the ten leading causes of morbidity for male and female. The same morbid conditions are identified for both sexes, which only differ in rates and consequently a slight difference in ranks. Infectious conditions are most common to both sexes.

Respiratory conditions like ARI, ALRTI and Pneumonia, Bronchitis and Tuberculosis were common to both sexes. However, in terms of the rate of occurrence, females tend to be more ill with these conditions than males except for respiratory TB. In summary, six out of the nine causes of morbidity common to both sexes were all have higher rates for female than male. However, the data were based on reports submitted with sex disaggregation only.

The 2014 report on notifiable diseases showed a large variation in morbidity rates by type of morbid conditions across regions except for ARMM which had no report by the time this publication was developed. Nevertheless, the national data on the top leading causes of morbidity was consistent with the reported leading causes of morbidity for each region, except for some regions which included Chickenpox and Typhoid Fever in top ten causes of morbidity. (Table 16)

Table 18 and Figure 13 show disease trends as to the number of cases and deaths from 1994 to 2014. Measles showed an increase both in number of cases and number of deaths, as compared to 2013. The diseases reported as the leading causes of morbidity in 2014 were much lower in rates and in number as compared to 2013. However, Measles cases were five times higher in 2014 as compared in 2013. It recorded a 513% increase from 2.3 cases per 100,000 population in 2013 to 14.1 per 100,000 population in 2014. On the other hand, Malaria and Dengue recorded the highest percent decrease in rate from 2013 to 2014, with 95.0% and 72.3% consecutively.

MORTALITY STATISTICS

Mortality data are fundamental source of demographic, geographic, and cause-of-death information. Although mortality data reflect just the opposite of the state of health of a population, specific age and sex mortality rates are important indicators of the health status of a population. It plays a vital role in understanding the health status of the population. It provides a basis for studying the occurrence of disease, its severity and how it affects the quality of life before death. Mortality statistics such as deaths by leading causes could already reveal the most prevalent life-threatening diseases. It helps detect the population's vulnerability to certain illnesses. Measuring and comparing mortality rates across populations also helps to highlight health differences among different groups of people.

Mortality statistics provide a baseline indicator that could define government priorities in terms of health policy formulation and service provision. It supplies basic information for planning appropriate preventive measures, stimulating medical research and highlighting topics of relevance in health education of the public. Further, examining trends of mortality over time assists in the evaluation of the health system.

Presented in this report were data on registered deaths that occurred in 2014 and were registered from January 2014 to March 2015. Deaths that were registered after March 2015 and those that were not registered at all were not included. The numbers were provided by the Vital Statistics Division of the Philippine Statistics Authority (PSA) through information obtained from Death Certificates (Municipal Form No. 103) transmitted by the City/Municipal Civil Registrars to the Office of the Civil Registrar General for processing and archiving. No adjustments for under registration or for delay in the submission of these certificates were made in the analysis.

The 2014 Philippine Health Statistics (PHS) presents different indicators on mortality such as Crude Death Rate (CDR), Infant Mortality Rate (IMR), Maternal Mortality Ratio (MMR), Age-Specific Death Rate (ASDR) and percentage of death by leading cause. The CDR and deaths by leading cause include deaths occurring in the entire population from all ages. ASDR indicates rates of death at different ages or the relative exposure of population of subgroups to the risk of dying. The IMR considers death to the most tender age, age less than one year old, when infants have not fully developed their immunity to certain diseases. The MMR is an important indicator of women's health before, during and after childbirth.

In addition to these indicators, special tables which feature the ten leading causes of death among lower age groups; 1-4, 5-9 and 10-14. These were intended for stakeholders who may consider population of age 1-14 as age of children. This report also included tables for fetal deaths.

GENERAL MORTALITY

In the Philippines, more than five people die for every one thousand population in 2014. This is equivalent to 536,999 registered deaths from all causes and all ages. Of these deaths, 57 percent or 307,861 were males and 43 percent or 229,138 were females. For every 100 female deaths, there correspond 134 male deaths and which constituted to a death sex ratio of 1.34.

The Crude Death Rate (CDR) per thousand population was computed at 5.4 deaths. There was no increase in last year's CDR. The two-decade trend of CDR from 1994 to 2014 is slowly increasing, although the increase is small, from 4 deaths to 5 deaths per thousand population. (Table 4)

It is consistent that number of male deaths are greater than female deaths. Consequently, males always have higher death rate than females. In 2014, CDR for male is 6.1 versus CDR for female, which is 4.6. Reports also showed that the highest occurrences of deaths were among the elderly persons, 70 years and over. It comprised more than 38 percent of total deaths with 207,429 deaths. However, death occurrence was least among age group 10-14 years with 0.8 percent. Mortality among under 1 year old is more than twice (21,108 or 3.9%) the number of deaths in ages 1-4 years (9,150 or 1.7%) The number of deaths increase as the people gets older, as shown in Table 19. Statistics show that the risk of dying is directly proportional to age, starting at 10 years old.

Reports showed that the highest incidence of death (by place of occurrence) was in CALABARZON with 78,326 or 14.6 percent of the total deaths, followed by NCR with 72,235 deaths or 13.5 percent and Central Luzon with 62,297 deaths or 11.6 percent. Deaths from these three regions comprised to almost 40 percent (39.7%) of the total deaths.

On the other hand, Autonomous Region of Muslim Mindanao (ARMM) reported the least number of deaths with 1,653 or 0.3 percent only. While, Cordillera Administrative Region (CAR) and CARAGA followed with a share of 1.4 percent and 2.5 percent respectively. These three regions were consistently low in terms of the number of deaths registered, which maybe a result of either effective health intervention or under registration.

On the other hand, Ilocos Region reported the highest CDR with 6.8 deaths per thousand of regional population. It is followed by Western Visayas with CDR of 6.6 deaths per thousand of the regional population. Whereas, ARMM posted the lowest CDR with only 0.5 deaths per thousand of regional population.

Eight (8) out of seventeen (17) regions in the country had exceeded the national CDR of 5.4; and the rest of the nine (9) regions fell below the national CDR. (Table 20)

Across all regions and in all age groups, except for 70 years and over, numbers of male deaths were generally higher than female deaths. A difference of 19.8 between CDRs of male and female could be attributable to difference of 7 years in life expectancy

of male and female which were 65 years and 72 years respectively. Based on the World Health Organization (WHO) data published in 2014, female tends to live 7 years longer than male, thus, more female dies at a later age.

The month of January recorded the highest number of deaths with 50,581 or 9.4 percent share from the total national deaths. While, the month of December recorded the least percent share of only 6.1 or 32,913 deaths.

On the average, around 1,471 deaths occurred daily or about 61 people die every hour in 2014. However, only the months of June, November and December did not exceed the average number of daily occurrences of deaths.

Out of 536,999 deaths registered in 2014, about 84 percent (450,152) were attributed to the top ten leading causes of death for the year. Mortality from all other causes comprised 16 percent of total deaths or 86,847 deaths. One in every four deaths was caused by Diseases of the Heart making it the number one leading cause of death. Diseases of the Heart remained to be the first with 132,825 deaths and with a computed rate of 133.0 deaths per 100,000 population. It recorded a 24.7 percent share from total deaths.

Diseases of the Heart had been consistently the number one cause of death for several years now. The 2014 number of deaths from this condition is 14,085 deaths (11.8%) higher than what was reported in 2013 which had 118,740 deaths. Males are more likely to die from this cause than females. Out of 132,825 deaths reported, 74,594 or 56 percent were males and 58,231 or 44 percent were females. Thus, the death sex ratio for Diseases of the Heart was 1.28 or 128 male deaths in every 100 female deaths. (Table 22)

Deaths from Diseases of the Heart came in many forms such as Acute and Chronic Rheumatic Heart Disease, Hypertension with heart involvement, Angina Pectoris, Acute Myocardial Infarction and others. Specifically, Acute Myocardial Infarction was responsible for 44,503 or 33.5 percent of deaths from Diseases of the Heart. About three out of five of the Acute Myocardial Infarction deaths were males (27,685; 62.2%) while, two in five deaths were females (16,818; 37.7%). Deaths from hypertensive heart diseases (21,534; 16.2%) and Chronic ischemic heart diseases (15,624; 11.7%) were the next two types of heart conditions that largely comprised deaths from Diseases of the Heart.

Most fatalities from Diseases of the Heart were elderly, belonging to 70 and over 70 years old with 61,558 deaths or 46.3 percent. The 2014 mortality statistics showed that deaths due to heart diseases were higher for men than women for age groups less than 70 years old. However, more women than men age 70 and older die from the said condition. (Table 28)

The next four diseases in the list which remained in their respective rankings for the past five years already were, Diseases of the Vascular System (54,934; 10.2%), Malignant Neoplasm (54,277; 10.1%), Pneumonia (52,460; 9.8%) and Accidents (35,447; 6.6%).

Eight out of the ten leading causes of deaths were male dominated. Female deaths were only higher than male deaths in Malignant Neoplasms and Diabetes Mellitus deaths. Furthermore, there was a significant difference in number of fatalities from Accidents between male and female. From the total 35,447 deaths from Accidents, 81.4 percent or 28,860 deaths were male and only 18.6 percent or 6,587 were female. This means that men were almost four times more likely to die from Accidents than women. (Table 22)

Nonetheless, the same killer diseases were identified as the ten leading causes of death for separate groups of male and female, which differed only in ranks when tabulated by sex. (Tables 24 and 25).

In 2014, majority of deaths from the ten leading causes of mortality were unattended by a medical doctor or any allied health officer in anytime during their illness or injury. Reports show that people who died from pulmonary diseases such as Pneumonia (66.8%) and Chronic lower respiratory diseases (68.0%) were commonly not seen by a health practitioner anytime during their illness or injury (Table 26).

Across all regions, only NCR had at least 50% of its deaths were attended by a medical doctor at the time of death than not. For the past decade, statistics show that even in NCR, a highly urbanized region and where both public and private health facilities are accessible, the percentage of attended death is still quite low, the highest is just 58.5%, which was recorded in 2005. Dying without the attention of a medical doctor could be somehow an evidence of unaffordable health cost in the country. (Table 27)

The table on number of deaths distributed into 17 cause-groups, reflected the proportion of deaths in reference to the ten leading causes of mortality. The group of Diseases of the Circulatory System had the highest percent share to total deaths with 35.0 or 187,759 deaths. This group included the top two killer diseases, Diseases of the Heart and Diseases of the Vascular System. (Table 30)

Table 31 showed that the 2014 death rates from Communicable Diseases decreased as compared to last year's rates. However, rate of the Diseases of the heart is continuously increasing since 1988. (Table 31)

The ten leading causes of mortality in a ten-year-period interval; 2014, 2004 and 1994 were shown in Table 32. For the past two decades, Filipinos died of mostly the same kind of diseases, Diseases of the Heart, Diseases of the Vascular System and Malignant Neoplasm. It can be noted from the three tables that the rate of dying from those same conditions were increasing through the years.

INFANT MORTALITY

The registered infant deaths slightly decreased from 12.5 infant deaths per 1000 live births in 2013 to 12.1 infant deaths per 1000 live births in 2014. The decrease was 3.2 percent. The 21,108 infant deaths comprised 3.9 percent of the total deaths (536,999) reported during the year. This represented a daily average of 58 infant deaths and was equivalent to an Infant Mortality Ratio (IMR) of 12.1 deaths per thousand live births. Statistics showed a decreasing trend in IMR from 1964 to 2014 although there were minimal increases at some point. (Table 4)

The National Capital Region (NCR) posted the highest IMR with 17.6 deaths per thousand live births or 4,221 deaths. The regions of CALABARZON and Ilocos followed with IMR of 14.5 and 13.5 respectively. In contrary, ARMM recorded the lowest IMR of 6.2 with 91 infant deaths. Majority of the 17 regions (12 regions) fall below the national IMR of 12.1 deaths per thousand live births. (Table 5)

October recorded the highest number of infant deaths in 2014 with a share of 9.7 percent with 2,049 infant deaths. This was translated to about 66 infant deaths per day. While, the month of December had the least number of infant deaths with 1,146 deaths or 5.4 percent of total infant deaths and an average of 37 deaths per day of that month. (Table 6)

From the total infant deaths of 21,108, more deaths occurred to infants less than 28 days old with 54.2 percent or 11,434 deaths than to infants one month to less than one year old with 45.8 percent or 9,674 deaths. (Table 33)

The top three leading causes of infant mortality were Pneumonia (2,809; 13.3%); Bacterial sepsis of newborn (2,451; 11.6%); and Respiratory distress of newborn (2,156; 10.2%). The listed top six leading causes of infant mortality in 2014 were the same with what was recorded in 2013. The rates and percentage shares from total infant deaths were just a little lower in 2014 when compared with the 2013. (Table 34)

Numbers of infant deaths were generally higher among male babies across all regions with 12,234 deaths or 57.9 percent than female babies with only 8,874 deaths or 42.1 percent with respect to total infant deaths. The infant death sex ratio was computed at 137 males per 100 female babies. (Table 35)

MATERNAL MORTALITY

Maternal health refers to the health of women during pregnancy, childhood and postpartum period. While motherhood is often a positive and fulfilling experience, for too many women it is associated with suffering, ill-health and even death. (WHO) On the other hand, maternal mortality is a mirror of a woman's health and nutritional status during pregnancy, at childbirth, or in the period after childbirth. It also highlights her access to professional medical services before, during and even after childbirth.

Statistics for this vital event are based on information obtained from the Death Certificates (Municipal Form No. 103) transmitted by the City/Municipal Civil Registrars to the National Statistics Office for processing and archiving. Included in this report are registered maternal deaths that occurred in 2014. No adjustments for under registration were done in the presentation.

In 2014, the number of registered maternal deaths reached a total of 1,570. The Maternal Mortality Ratio (MMR) is 0.9 per thousand live birth. (Table 4)

The Davao Region recorded the highest MMR of 1.3 maternal deaths per thousand live births. While CAR recorded the lowest with 0.4 deaths per thousand livebirths. Six (6) out of 17 regions had MMR higher than the national ratio of 0.9. (Table 5)

Statistics showed that 85 percent of maternal deaths were direct obstetric deaths. Second major cause was abortion (10.6%) and others were because of the indirect obstetric causes (3.8%). (Table 36)

Statistics also showed that MMR was highest in women age 45 to 49 years, with ratio of 3.2 maternal deaths per 1000 live births. It can be noticed, that, the risk of dying gets higher as the age of mother gets older. (Table 37)

FETAL DEATHS

The information presented herein was obtained from the fetal death certificates (Municipal Form No. 103A) submitted by the City/Municipal Registrars from all over the country to the Office of the Civil Registrar General for processing and archiving purposes. There was no adjustment for under registration in the presentation.

The total numbers of registered fetal deaths were 7,664 which was equivalent to a fetal death ratio (FDR) of 4.4 per one thousand livebirth. There was an increase in number of about 2.5 percent from previous year's fetal deaths. This was translated to an average of 21 fetal deaths per day for the year 2014. (Table 4)

The FDR was highest in NCR with 6.9 fetal deaths per thousand live births. The Central Visayas Region followed in second rank with FDR of 6.2 fetal deaths per thousand live births. Two (2) more regions recorded a higher FDR than the national FDR of 4.4 fetal deaths per thousand live births. These were Ilocos (5.2) and Calabarzon (5.1). (Table 5)

Highest incidence of fetal deaths in 2014 was in September with 766 fetal deaths or 10.0 percent. The months of October and November followed with a percentage share of 9.7% with 743 fetal deaths and 9.2 % with 707 fetal deaths respectively. (Table 6)

Almost all (98.3%) of fetal deaths were attended by qualified medical professionals such as physician (95.9%), nurse (0.2%) and midwife (2.2%). The rest or 1.7 percent were attended by hilot or unlicensed midwife. (Table 38)

Most deaths of fetal deaths were caused by disorders related to short gestation and low birth weight (2,075 deaths) and it comprised more than one-fourth of the total number of fetal deaths or 27.0 percent. However, 20.9 percent or 1,607 fetal deaths still died from an unspecified cause. The reason may be for the unspecified cause of death was because of incomplete documentation (Table 39).

Most number of fetal deaths occurred to mothers in age-group 25-29 years, with 1,689 reported deaths or 22.0 percent of total fetal deaths. High number deaths of fetal deaths were also registered to mothers of ages 20-24 years (1,649; 21.5%) and 30-34 years (1,627; 21.2%). However, statistics show that older mother (40-49 years old) had higher risk of having fetal deaths than the younger ones. The ratio of fetal deaths to livebirths was high on mothers belonging to age groups 40-44 (8.9) and 45-49 years (7.7). (Table 40)

MORTALITY AMONG LOWER AGE GROUPS

The 2014 ten leading causes of mortality among lower age groups, specifically to age groups 1-4; 5-9; 10-14 years were presented in Table 41.

Pneumonia was the number one cause of death among children of age 1-9 years and third in children ages 10-14 years. It is important to note also, that statistics showed that deaths due to accidental drowning and submersion were still common cause of deaths of children from these age groups. (Table 41)

MORTALITY AMONG IMMUNIZABLE DISEASES

The number of deaths from immunizable diseases, among 0-14 years old were still notable in 2014. The highest number of deaths was due to all forms of Tuberculosis, which did not only include Respiratory TB but also TB of the Meninges, with 472 deaths and followed by Measles with 453 deaths. Deaths due to Measles was high in children in age groups less than one year old (237; 11.4) and to age group 1-4 years old (196; 2.3).

MORTALITY: TEN (10) LEADING CAUSES
Number & Rate/100,000 Population
Philippines
2014, 2004, 1994

Causes	2014	
	Number	Rate
1. Diseases of the heart (I00-I13,I20-I52)	132,825	133.0
2. Diseases of the vascular system (I60-I99)	54,934	55.0
3. Malignant neoplasms (C00-C97)	54,277	54.3
4. Pneumonia (J12-J18)	52,460	52.5
5. Accidents ** (V01-Y89)	35,447	35.5
6. Diabetes mellitus (E10-E14)	30,654	30.7
7. Chronic lower respiratory diseases (J40-J47)	24,082	24.1
8. Tuberculosis, all forms (A15-A19)	23,747	23.8
9. Diseases of the digestive system (K00-K92)	21,187	21.2
10. Diseases of the genitourinary system (N00-N98)	20,539	20.6

Causes	2004	
	Number	Rate
1. Diseases of the heart	70,861	84.8
2. Diseases of the vascular system	51,680	61.8
3. Malignant neoplasms	40,524	48.5
4. Accidents	34,483	41.3
5. Pneumonia	32,098	38.4
6. Tuberculosis, all forms	25,870	31.0
7. Ill-defined and unknown causes of mortality	21,280	25.5
8. Chronic lower respiratory diseases	18,975	22.7
9. Diabetes mellitus	16,552	19.8
10. Certain conditions originating in the perinatal period	13,180	15.8

Causes	1994	
	Number	Rate
1. Diseases of the heart	50,307	73.3
2. Diseases of the vascular system	39,191	57.1
3. Pneumonia	28,132	41.0
4. Malignant neoplasms	28,110	41.0
5. Tuberculosis, all forms	27,292	39.8
6. Accidents	14,752	21.5
7. Chronic obstructive pulmonary disease and allied conditions	11,405	16.6
8. Diarrheal diseases	8,382	12.2
9. Other diseases of the respiratory system	6,383	9.3
10. Diabetes mellitus	6,105	8.9

Table 41

MORTALITY AMONG LOWER AGE GROUP : TEN (10) LEADING CAUSES
by Age Group & Sex
Number & Rate / 100,000 Population
Philippines, 2014

Cause	1-4 Years			
	Male	Female	Both Sexes	Rate*
1 Pneumonia	1,054	933	1,987	23.7
2 Diarrhea and gastroenteritis of presumed infectious origin	375	293	668	8.0
3 Congenital malformations, deformations and chromosomal abnormalities	356	294	650	7.8
4 Remainder diseases of the nervous system	284	247	531	6.3
5 Neoplasms	281	189	470	5.6
6 Accidental drowning and submersion	322	142	464	5.5
7 Chronic lower respiratory infections	202	220	422	5.0
8 Septicaemia (Sepsis)	206	174	380	4.5
9 Meningitis	180	148	328	3.9
10 Remainder endocrine, nutritional and metabolic diseases	147	127	274	3.3

Excludes ill-defined and unknown causes of mortality (n= 332, 9th rank)

Cause	5-9 Years			
	Male	Female	Both Sexes	Rate*
1 Pneumonia	252	235	487	4.6
2 Accidental drowning and submersion	299	151	450	4.3
3 Neoplasms	210	174	384	3.6
4 Remainder diseases of the nervous system	227	135	362	3.4
5 Transport accident	159	94	253	2.4
6 Other arthropod-borne viral fevers and viral haemorrhagic fevers	101	150	251	2.4
7 Congenital malformations, deformations and chromosomal abnormalities	142	109	251	2.4
8 All other external causes	135	84	219	2.1
9 Leukemia	110	81	191	1.8
10 Meningitis	86	76	162	1.5

Excludes ill-defined and unknown causes of mortality (n= 170, 10th rank)

Cause	10-14 Years			
	Male	Female	Both Sexes	Rate*
1 Neoplasms	254	216	470	4.4
2 Remainder diseases of the nervous system	204	150	354	3.3
3 Pneumonia	191	158	349	3.3
4 Accidental drowning and submersion	214	102	316	3.0
5 All other external causes	177	73	250	2.3
6 Congenital malformations, deformations and chromosomal abnormalities	105	102	207	1.9
7 Leukemia	119	85	204	1.9
8 Transport accident	139	56	195	1.8
9 Other heart diseases	89	76	151	1.4
10 Acute rheumatic fever and chronic rheumatic heart diseases	61	80	141	1.3

Excludes ill-defined and unknown causes of mortality (n= 151, 9th rank)

* rate per 100,000 population of corresponding age-group

Table 42

MORTALITY AMONG IMMUNIZABLE DISEASES
(Under 1; 1 - 4; 5 - 9; 10 - 14 Years)
Number & Rate/100,000 Population*
Philippines, 2014

Cause	Total		Under 1		1 - 4 Years		5 - 9 Years		10 - 14 Years	
	Number	Rate	Number	Rate	Number	Rate	Number	Rate	Number	Rate
1. Measles (B05)	453	1.4	237	11.4	196	2.3	12	0.1	8	0.1
2. Tetanus (A33, A35)	90	0.3	20	1.0	16	0.2	28	0.3	26	0.2
3. Tuberculosis, all forms (A15-A19; B90)	472	1.5	47	2.3	135	1.6	127	1.2	163	1.5
4. Diphtheria (A36)	21	0.1	2	0.1	9	0.1	8	0.1	2	0.0
5. Acute Poliomyelitis, including late effects (A80, B91)	-	0.0	-	0.0	-	0.0	0	0.0	-	0.0

* population of specific age group
