

How to save the coordinates of a waypoint in GPS Essentials

This is an addendum to the “Collecting Geographic Coordinates Using a GPS-enabled Android smartphone/tablet” protocol should you wish to save the waypoints in your device. Below are the following steps on how to do this after you have gathered the necessary information [i.e. latitude, longitude, accuracy (below 15m), and number of satellites **used** (at least 5)]:

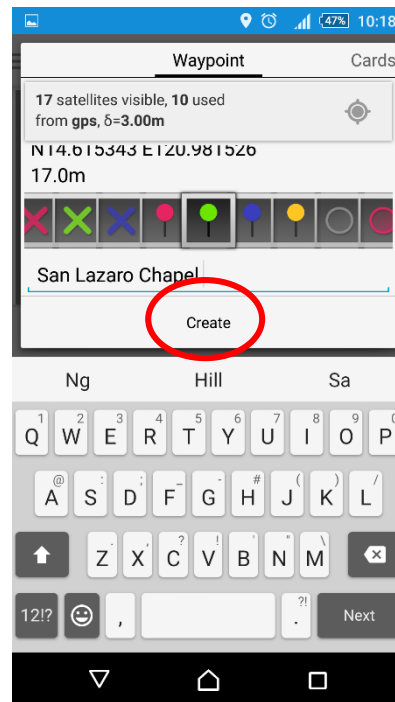

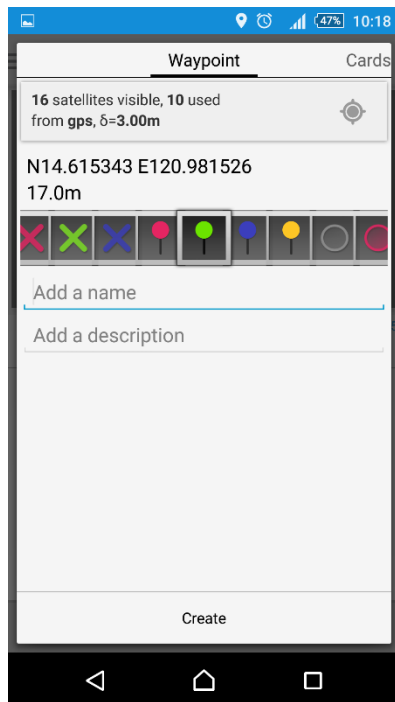

1. Go back to the Main Menu page of GPS Essentials and tap on the **Waypoints** icon.

2. This page lists all of your saved waypoints. At the bottom part of the screen, tap the **Add Waypoint** button symbolized by a “+” sign enclosed in a circle which is shown in the image below.

- You will be brought to the screen as shown below. Edit the name of the waypoint. You can also add a description to your waypoint and even change the icon of the waypoint marker. Tap **Create** at the bottom of the screen to save.

- You will be returned to the Waypoints page with your most recently saved waypoint listed at the bottom of the list. You can view the information of any saved waypoint by tapping on it.
Note: Accuracy and number of satellites will NOT be saved in this page so be sure to write them down before saving your waypoint.
