F O R E W O R D

The Disease Intelligence Center of the Department of Health in line with its function, and always aware of the major role that Health Statistics play in Public Health, takes pleasure in presenting this report - Philippines Health Statistics, 1966.

Through the established mechanisms of collection, data and information, quantitative as well as qualitative, on the vital events of birth and death, on disease, and on other various conditions and factors related to health, are being routinely gathered from all over the country, through the field health personnel. The data thus collected, have been summarized, sorted, analyzed and interpreted. Such meaningful information extracted is presented in tables and where appropriate, also in graphs, and published in a series of publications of the Disease Intelligence Center, and are disseminated to the health administrators at various levels.

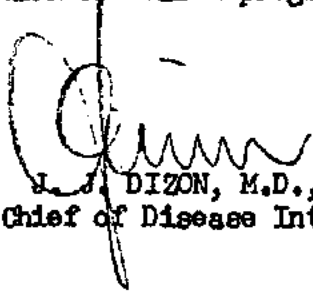

This report represents the final statistical data collected on Births and Deaths, as well as on the Notifiable Diseases, as they occurred during the year 1966. It has to be emphasized, however, that the adequacy and accuracy of the data collected depend so much on the degree of implementation of the basic statutes governing the registration of vital events, and the reporting of Notifiable Diseases. Such other data and information on health conditions and services, as well as information that is essentially epidemiologic in nature, are not included in this report, but are released separately whenever indicated.

The coverage and presentation of this report are essentially similar to the 1965 report. Statistical tables, graphs and diagrams presented are based on health reports of registered births, deaths and foetal deaths and reported cases of notifiable diseases for the calendar year 1966. Some rate tables, graphs and diagrams present data since 1920; some give figures for the past 5 years, while most tables and graphs show data for 1966 only. Population figures are also incorporated in this report for computation of statistical indices and constants.

This report is organized and presented as follows:

1. Introduction: Sources, classification, analysis and interpretation of data
2. Natality Statistics: Text by subject and related tables, graphs and diagrams
3. Notifiable Diseases: Text by subject and related tables; trends of cases and deaths
4. Mortality Statistics: Total, infant, maternal and foetal: text by subject and related tables, graphs and diagrams.

It is hoped that this annual report on Philippines Health Statistics may provide those concerned with the prevention and control of disease and the promotion, protection, and maintenance of the health of the nation, the necessary statistical basis for the planning, implementation and evaluation of health programs and services.

b. Influenza.....	1180
c. Respiratory Tuberculosis, Beriberi and Malaria.....	1200
d. Diphtheria, Poliomyelitis and H-Fever.....	1220

V. MORTALITY STATISTICS

A. Tables

19. Deaths From All Causes By Age, Sex and Percent Age Distribution: Philippines, 1966.....	130
20. Death Rates By Age and Sex: Philippines and Each Health Region, 1966.....	131
21. Deaths From All Causes By age, Sex and Month: Philippines, 1966.....	134

22.	Number of Deaths and Crude Death Rates By Month and Sex: Philippines and Each Health Region, 1966.....	136
✓ 23.	Deaths From All Causes By Age and Sex: Philippines and Each Health Region, Province and City, 1966.....	139
24.	Mortality From 10 Leading Causes of Death: Philippines, 5-Yr. Average (1961-1965) and 1966.....	154
→ 25.	Mortality From 10 Leading Causes of Death By Age and Sex: Philippines, 1966.....	155
26.	Number and Percentage Distribution of 10 Leading Causes of Deaths By Attendance, Philippines, 1966....	157
27.	Number and Percentage Distribution of the Ten (10) Leading Causes of Medically Attended Deaths By Attendant; Philippines, 1966.....	158
28.	Mortality From 10 Leading Causes of Death For Each Health Region: Philippines, 1966.....	159
29.	Deaths From All Causes and Death Rates By Causes, By Age and Sex: Philippines, 1966.....	161
30.	Deaths From All Causes By Causes By Attendance: Philippines, 1966.....	221
31.	Number and Percentage Distribution of Deaths From All Causes By Group Causes: Philippines, 1966..	227
32.	Number and Percentage of Deaths By Attendance For the Philippines and Each Health Region, 1966.....	228
33.	Number of Deaths and Death Rates From Communicable Diseases, Malignant Neoplasms and Diseases of the Heart: Philippines, 1920-1966.....	229
34.	Death Rates: Philippines and Each Health Region, Province and City, 1957-1966.....	230
35.	Mortality From 10 Leading Causes of Death: Philippines, 1936, 1946, 1956 and 1966.....	233
36.	Deaths Under 1 Year By Sex: Philippines and Each Health Region, Province and City, 1966.....	234
37.	Deaths Under 1 Year; Infant Mortality Rates and Percentage Distribution By Age: Philippines, 5-Year Average (1961-1965) and 1966.....	236
38.	Deaths Under 1 Year By Age and Sex: Philippines and Each Health Region, 1966.....	237
39.	Infant Death Rates By Age and Sex: Philippines and Each Health Region, 1966.....	239
40.	Infant Deaths By Month and Sex: Philippines and Each Health Region, 1966.....	241
41.	Infant Deaths and Infant Death Rates By Month: Philippines and Each Health Region, 1966.....	242
42.	Ten (10) Leading Causes of Infant Deaths: Philippines, 5-Year Average (1961-1965) and 1966.....	243
43.	Number and Percentage Distribution of the Ten (10) Leading Causes of Deaths Under 1 Year By Attendance: Philippines, 1966.....	244

44.	Infant Deaths and Infant Death Rates From 30 Selected Causes By Age and Sex: Philippines, 1966.....	245
45.	Infant Death and Neonatal Death Rates By Cause and Sex: Philippines, 1966.....	260
46.	Deaths Under 1 Year By Group Causes and Sex: Philippines, 1966.....	261
47.	Infant Mortality Rates By Age: Philippines, 1961-1966.....	262
48.	Infant, Neonatal and 28 Days to Under 1 Year Mortality Rates: Philippines, 1957-1966.....	263
49.	Maternal Deaths By Age: Philippines and Each Health Region, Province and City, 1966.....	264
50.	Maternal Deaths and Maternal Death Rates By Main Cause: Philippines and Each Health Region, 1966.....	267
51.	Number and Percentage Distribution of Maternal Deaths By Main Cause: Philippines and Each Health Region, 1966.....	268
52.	Number and Percentage Distribution of Maternal Deaths By Attendance: Philippines, 1966.....	269
53.	Maternal Deaths and Maternal Death Rates By Month: Philippines and Each Health Region, 1966.....	270
54.	Maternal Deaths and Maternal Death Rates By Main Cause: Philippines, 1962-1966.....	271
55.	Foetal Deaths and Foetal Death Rates By Cause: Philippines and Each Health Region, 1966.....	272
56.	Number and Percentage Distribution of Foetal Deaths By Group Causes: Philippines, 1966.....	273
57.	Number and Percentage Distribution of Foetal Deaths By Cause and Medical Attendance: Philippines, 1966...	274
58.	Number and Percentage Distribution of Foetal Deaths With Medical Attendance By Cause and Attendant: Philippines, 1966.....	275
59.	Foetal Deaths and Foetal Death Rates By Month For The Philippines and Each Health Region, 1966.....	276

41. Foetal Deaths By Attendance: Philippines, 1966.....	274D

INTRODUCTION

A. SOURCES OF DATA

1. Live Birth, Death and Foetal Death Statistics - All tabulations on live births, deaths from all causes, deaths under 1 year, maternal deaths and foetal deaths are based on data gathered by all field personnel from Local Civil Registries in every city, municipality and municipal district throughout the country where births and deaths and other vital events are registered as provided for in the Civil Registry Law of the Philippines (Act 3753)¹. Data on live births are contained in consolidated health reports (Nativity Report - DIC Form No. 4) received from all Provincial and City Officers every month, while data on deaths from all causes and foetal deaths are contained in Death Record Cards (DIC Form No. 3) in which information from each Certificate of Death and Foetal Death are copied. These cards are received from all City and Municipal Health Officers every month. The statistical information in these reports are edited, classified, punched in IBM cards, compiled, analyzed and interpreted in the Disease Intelligence Center.

2. Notifiable Diseases - Data on notifiable diseases are based on information gathered by field health personnel. The Law on Reporting of Communicable Diseases (Act 3573) provides that any case of communicable disease shall be reported immediately to the nearest Rural Health Unit (health station). Data on these reported cases which are contained in consolidated health reports (DIC Form No. 2), received from all Provincial and City Health Officers every week, are then edited, classified, punched in IBM cards, compiled, analyzed and evaluated in the Disease Intelligence Center.

3. Standard Certificates - Standard Certificates of Birth, Death and Foetal Death are issued by the Bureau of the Census and Statistics, and serve as legal documents for the registration of live births, deaths and foetal deaths throughout the country. They have been revised from time to time in close collaboration with other government agencies concerned with vital statistics. The most recent revision was in 1956, when the Certificates were made to conform with those recommended by the World Health Assembly for international use. These documents are filed with the Local Civil Registrar, from which records vital statistical reports of field health personnel are based.

¹ In this issue, data on births and deaths which were not available were obtained from the Bureau of the Census and Statistics,

4. Population Statistics - The official population estimates since 1920, as computed by the Bureau of the Census and Statistics, using the geometric method, are presented in this report. The bases for the yearly population figures are the censuses of 1918, 1939, 1948 and 1960. The 1966 population for the Philippines and each region, province and city were estimated from the latest census (1960) which indicated an annual rate of increase of 3.06%.

B. CLASSIFICATION OF DATA

Classification of health statistics and population statistics must be made in accordance with similarly defined system and tabulations must be done in comparable groups in order to make use of the principal value of both data. Thus, variables common to both, i.e., geographic area, age and sex have been similarly classified and tabulated in this report.

1. Geographic Classification - Live births; deaths from all causes; infant, maternal and foetal deaths; and data on notifiable diseases have been classified by place of occurrence - region, province and city - the first being a geographical division created as a result of the reorganization of the Department of Health and the other two being political divisions of the country. There are eight (8) regions; fifty-six (56) provinces and forty-three (43) cities. There is no classification of the place of occurrence as to whether it is rural or urban because of the lack of standard criteria.

2. Age - There is no valid information with regard to the accuracy of age of a reported morbid case. Regarding registered deaths, the age of the decedent is fully determined by the date of birth. However, some of the vital records are filled with the age not recorded or the data of birth not indicated. Thus, misstatement of age on vital records may be assumed but to a negligible degree. The age classification used in this report is consistent with those recommended for international use by the World Health Organization.

3. Diseases and Causes of Deaths - Morbidity and mortality statistics published by the Department of Health are classified and tabulated in accordance with the seventh Revision of the International Classification of Diseases, Injuries and Causes of Death. In this report, the 3-digit classification was used for morbidity as well as for total mortality statistics, while the 2-digit classification was used for foetal deaths.

A considerable number of Certificates of Death filed in Local Civil Registries throughout the country gives more than one disease or condition as the certified cause of death. Standard statistical practice requires that a case involving more than one cause of death must be assigned a single cause. The Rules for Classification of the Underlying Cause of Death adopted by the World Health Assembly was used, in determining the one cause as the underlying cause of death.

4. Sex - Classification by sex is made in relation to other factors such as age, nationality, date and place of occurrence. Thus, some tabulations presented in this report may be considered as four-fold tables with sex as one of the attributes of classification.

C. ANALYSIS AND INTERPRETATION OF DATA

Health statistics are very useful for a variety of administrative and research purposes. However, they can not correctly be interpreted unless pertinent qualifying factors, aside from the method of classification, are taken into consideration.

Some of the factors limiting the use of the statistical data emanate from discrepancies in the original records or from the impracticability of tabulating these data in very detailed items. While these defects do exist, nevertheless, the value of these data for most general purposes is indispensable. The exact evaluation of health statistics or the analysis of small differences necessitates careful study of a variety of related elements. However, the major trends and differences may not usually be altered materially by finer analysis.

1. Small Frequencies - The number of births or death reported for an area or community, or the number of ailments, represents complete counts of such events. Such being the case, they are not subject to sampling errors although they are subject to errors in the registration process or reporting system. When data are used for analytical purposes, as for example, the comparison of rate over a time period or for different areas, the number of events that actually occurred may be considered as one of a large series of possible results that could have risen under the same circumstances. In accordance with certain statistical assumptions, the probable range of values may be estimated from the actual figures.

2. Computation of Statistical Indices - In the computation of statistical indices for the Philippines and each health region, province and city, the standard formulae are used. Thus, the crude birth and death rates are per 1,000 population; the infant, neonatal, maternal, and foetal death rates are per 1,000 live births; and the specific disease morbidity and mortality rates classified either by location, age or sex are per 100,000 population.

3. Completeness of Registration and Notification - In the Philippines, although the law provides for a compulsory registration of births, deaths and foetal deaths (Act 3753) and the reporting of notifiable diseases (Act 3573), there are deficiencies in the observance of the law due to a variety of factors.

Tests for completeness of birth and death registration were made in 1956 in Nueva Ecija, in Health Region No. 3. The tests indicated an underregistration of births by 30% and deaths by 10% for the whole province.

A more recent and more extensive survey on the completeness of death registration in all the provinces (32) and cities (18) of Health Regions 1, 2, 3, and 4, and one province each in Regions 5 and 6 was conducted in 1961-1962. This revealed that of the randomly selected names of persons buried in cemeteries in more recent years (1959-1962), 27.3% do not appear in the Death Registers of the Local Civil Registrars.

In view of the limited scope of these two studies the percentage of underregistration cannot be made to apply on a nationwide basis. Corrections for underregistration may only be made after the latter survey has been completed for the whole archipelago. For the present, it is safe to state that there is ample evidence that incomplete registration is still a problem in many areas in the country.

Foetal death registration is probably significantly incomplete in all areas in the country. Again, there is no available information on the incompleteness of registration.

Completeness of reporting of notifiable diseases varies greatly by disease and by area. In general, reporting is apparently incomplete although there is no exact information regarding this subject.

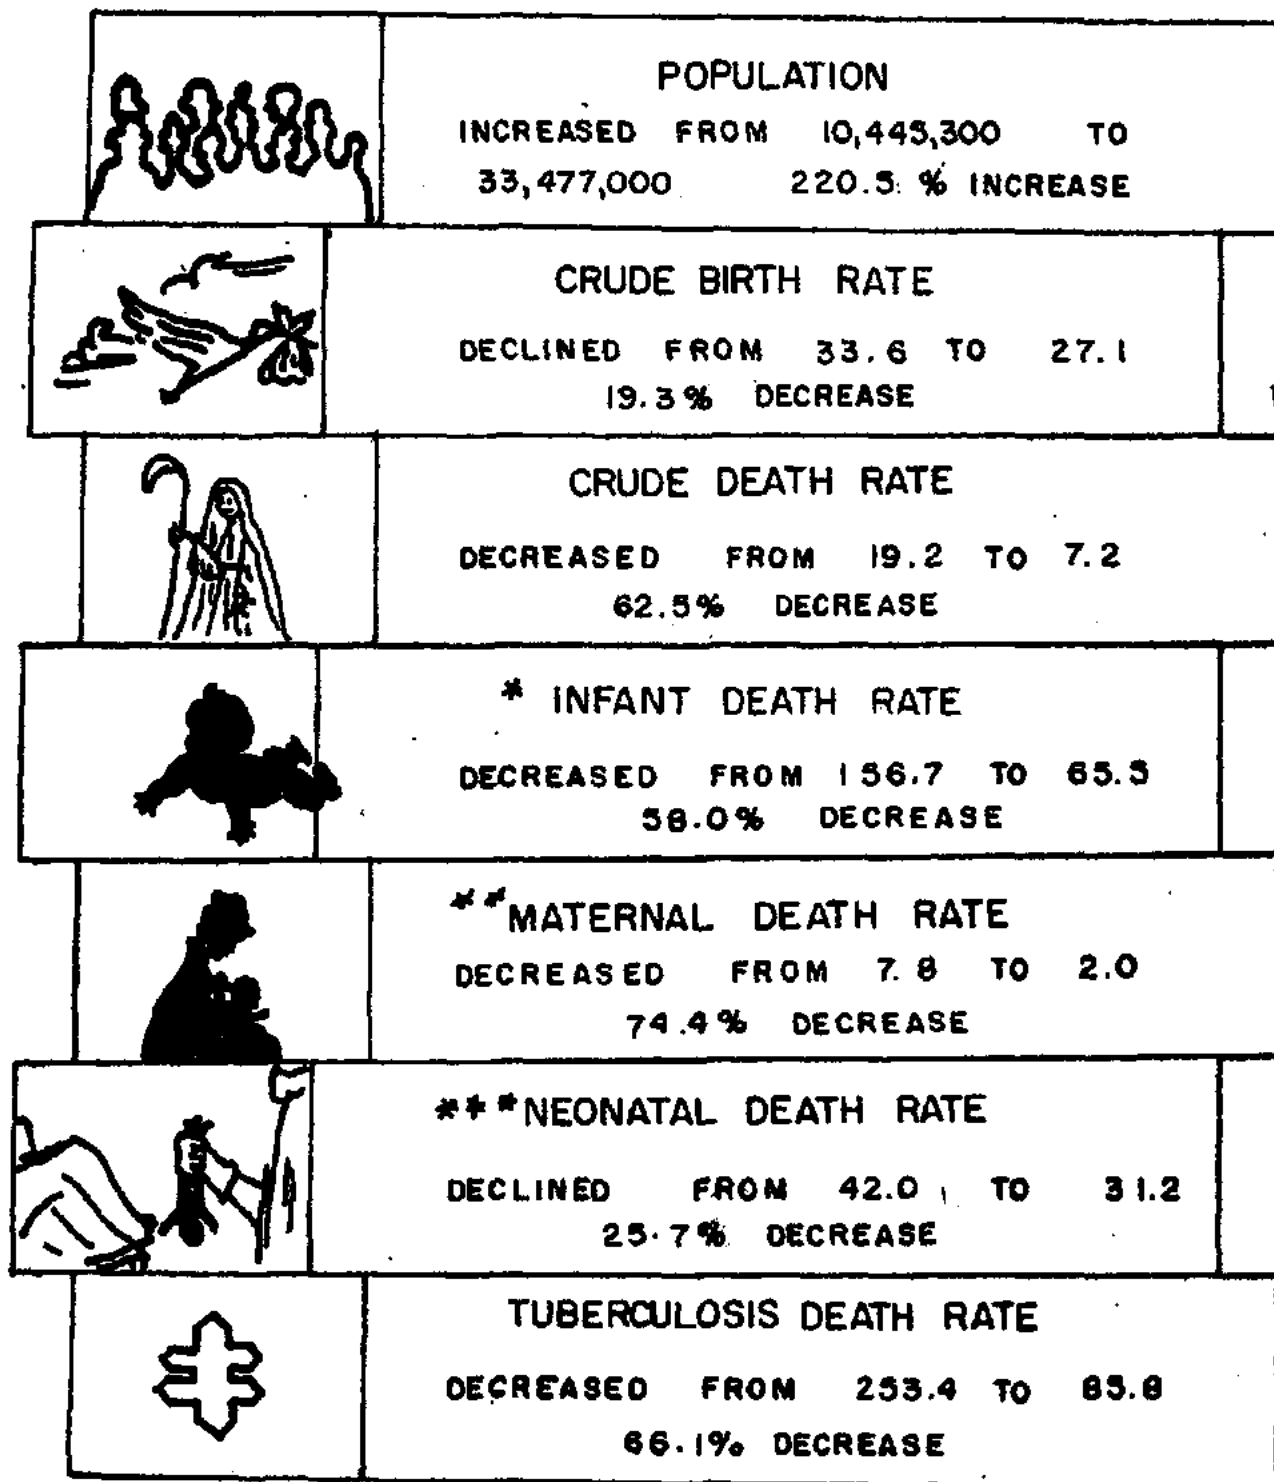

4. Population Bases - In order to insure statistical comparability, the vital and health statistical indices presented in this re-

post for the Philippines and each health region, province and city were computed on the basis of the official population estimates of the Bureau of the Census and Statistics. These population estimates were computed on the basis of the latest census taken of the country on February 15, 1960.

5. Allocation of Vital Events - All data in this report were tabulated according to place of occurrence and not by place of residence; Philippine laws provide that all vital events and cases of notifiable diseases must be registered and reported, respectively, by place of occurrence. This may not give an accurate indication of the relative health and fertility conditions. However, since inter-provincial travel for long periods of time is practically nil in the country, allocation by occurrence and residence may not show substantial difference.

NATALITY STATISTICS

Birth statistics presented and discussed in this report are based on data gathered by field health personnel from the birth registers of all Local Civil Registrars in every city, municipality and municipal district throughout the Philippines.

In 1966, there were 908,826 registered live births. This figure represents an increase of 4.3% over that of the previous year (871,175). The highest number of birth(81,196) was registered in December and the lowest (70,405) in April, representing 8.9% and 7.7% of total births respectively. The average monthly number of births is 75,736.

The crude birth rate of 27.1 in 1966 is higher by .0.1 than that of 1965 (27.0) and lower than that of 1922 by 7.6. The average birth rate for the past 10 years(1957-1965) was 28.5 per 1,000 population. While the population has increased by 206.9% since 1922, the improvement in birth registration during this period was not consistent with the tremendous population increase.

The figure of 908,826 represents the total number of live births registered in 1966 and does not represent the actual total number of babies born alive in that year; and since there is no measure of the extent of under-registration of births which is valid for the whole country, no corrections was made for under-registration of births.

Trend of Crude Birth Rate - The number of live births registered and the corresponding birth rates for the past 45 years (since 1922) are presented in this report (Table 4). During this period, the crude birth rate showed a general declining trend and the changes were rather slow and irregular during the later years. The 1922 rates was 34.7 per 1,000 population. This increased to 35.2 in 1923. Incidentally, this rate is the all time highest up to the present. The rate was again almost stable at 32 per 1,000 population from 1930 to 1940 with slight variations in 1934, 1935 and 1937 when the rates were 31.1, 31.3 and 33.3 respectively. After World War II(1946), the crude rate started as 28.9 and increased to 31.5 in 1948. It went down to 30.9 in 1949, only to increase again to 31.6 in 1950. A uniform rate of 30 births per 1,000 population was recorded from 1951 to 1956 except in 1953 when it slightly decreased to 29.7. In 1957 and 1958, the rates declined to 29.6 and 29.4 respectively, but in 1959 it increased to 30.0. From then on a declining pattern of the crude birth rate could be observed. However, in 1962, it increased

slightly to 28.4. In 1965, the rate dropped to an all time lowest in 45 years - 27.0 births per 1,000 population. It increased very slightly in 1966 to 27.1

Births By Sex - Of the total 908,826 births registered in 1966, 472,950 were males and 435,876 were females, representing 52.0% and 48.0% of the total respectively. The proportion of the male births to the female births for 1966 is almost the same as that of the past two years 1964, 1965.

Births By Nationality - Birth statistics in this report are classified by nationality as Filipino, Chinese, American and others. Of the total births in 1966, 905,215 or 99.60% are Filipinos, 2,615 or 0.29% are Chinese, 763 representing 0.08% are Americans and 233 (0.03%) belong to other nationalities. The greatest number of non-Filipino births was registered in Region 3 while Region 2 reported the least. Manila registered the highest number of foreign births 2,013 (2.27%) out of 88,542 births which is due to the fact that the centers of commerce and trade are located in this city, moreover it is the port of entry for foreigners.

Attendance Of Births - Of the 908,826 births registered for 1966 508,465 (55.9%) had the benefits of medical attendance (Table 8). This figure shows an increase of 5.4% over that of the previous year. It is observed that almost one half of all the deliveries (44.0%) were not medically attended. Of those given medical attendance, 36.8% was delivered by physician, 13.4% by nurses and 49.8% by midwives. Health Region 3 had the highest percentage (74.0%) of births medically attended while Region 2 had the lowest percentage - 36.6%.

Births By Place Of Delivery - As shown in Table 9, there were 727,843 births delivered in the homes and 180,983 delivered in the hospitals. These figures represent 80.1% and 19.9% of the total respectively. Of the eight health regions, Region 3 reported the greatest number of hospital deliveries. This is due to the fact that most of the hospitals are situated in this region. Even in the cities majority of the deliveries are in the homes. Of the cities, Trece Martires reported the highest percentage of hospital deliveries (99.1%). Of the provinces, Rizal reported the highest percentage - 15.6%.

Birth Rates By Month - The monthly birth rates for 1966 showed a major peak in February (29.2) and a minor peak (28.6) in December as shown in Table 11 and Figure 10. In January the rate was 28.5. It increased to its highest peak in February, but went down to 25.6 and 25.9 in April and May respectively. A slight increase was noticed in June. It dropped again to 25.0 in July reaching the all-time lowest. Then it kept rising until September, only to slightly fall again in October. In November it started increasing again so that in December the minor peak was reached.

Crude rates by month from 1957 to 1966 showed a fairly regular pattern of seasonal movements during the year. A major and minor peak either in January, February or December of each year and troughs at the end of the first quarter are observed. The curves show that the lowest rate was observed around the middle of the year, while the higher rates were at the first and last months of the year. The monthly troughs were almost of the same depth and width throughout the year.

Crude Birth Rates By Location - Table 5 shows that among the provinces, Tarlac, had the highest birth rate (36.4 births per 1,000 population) while Lanao del Sur had the lowest (7.6). Among the cities Trece Martires registered the highest rate (64.0) while Basilan had the lowest rate (4.7).

Of the health regions, Region 3 had the highest birth rate (36.4 births per 1,000 population) while Region 7 had the lowest rate (16.4).

Throughout the country (provinces and cities) Trece Martires reported the highest crude birth rate (64.0).

Variations in the crude birth rate in different places all over the country depend largely on the extent of the completeness of birth registration and do not necessarily depict the fertility of the people in those areas.

General Fertility Rate - Fertility of a country may be measured by the rate representing the total number of live births per 1,000 female population of the ages 15-44 years. Table 6 shows the fertility rates for the Philippines and each region by month in 1966.

The fertility rates in 1965 and 1966 were 133.4 and 134.5 respectively. It can be observed that the rate increased by 1.1 or 1.0%.

The province of Lanao was divided into Lanao del Norte and Lanao del Sur in 1959; Surigao was divided into Surigao del Norte and Surigao del Sur in 1960.

Lapu-Lapu City was included in Cebu province.

CRUDE BIRTH AND DEATH RATES; AND INFANT, MATERNAL AND FOETAL DEATH RATES BY MONTHS, PHILIPPINES, 1966

Figure 12

NOTIFIABLE DISEASES STATISTICS

All the 41 notifiable diseases in the Philippines are communicable, except Beriberi and Malignant Neoplasms. According to Act 3573 (Law on Reporting of Communicable Diseases) the following diseases must be reported to the nearest health station: Cholera, Plague, Relapsing Fever, Smallpox, Typhus (Epidemic), Yellow Fever, Anthrax, Gastro-enteritis and colitis, Diphtheria, Amoebic dysentery, Other forms of dysentery, Food poisoning, Poliomyelitis, Typhoid and Paratyphoid fevers, Acute infectious encephalitis, Beriberi, Pneumonias, Bronchitis, Chancroid, Filariasis, Gonococcal infection, Infectious hepatitis, Influenza, Leprosy, Lymphogranuloma venereum, Malaria, Measles, Meningococcal infection, Mumps, Malignant neoplasms, Ophthalmia neonatorum, Rabies, Schistosomiasis, Syphilis, Tetanus, Respiratory tuberculosis, Other forms of tuberculosis, Varicella, Whooping cough, Yaws, and Acute toxic febrile condition with hemorrhage (H-Fever). The first six diseases are quarantinable.

Trends of Notifiable Diseases - The incidence and mortality of notifiable diseases for the past 10 years (1957-1966) are shown in Table 18. Figure 15 shows the case and death rates of the most prevalent notifiable (communicable) diseases during the last decade. It is observed that deaths from notifiable diseases showed continued declining trend; on the other hand, the incidence from certain diseases such as Respiratory Tuberculosis, Gastro-enteritis, Bronchitis, Diphtheria, Whooping cough, Tetanus, Leprosy and Varicella showed a generally increasing trend during the early part of the ten-year period up to 1958. It is believed that the increase in the number of cases is due to better diagnosis and notification rather than an actual rise in incidence, in as much as the deaths from these diseases throughout the same period were on a declining trend. Since 1959, the incidence from these diseases began to decline. The decreasing trend of Dysentery and Typhoid and Paratyphoid Fevers was apparently due to the improvement in environmental sanitation and intensified immunization programs. Malaria has gradually decreased because of intensified campaign against this malady. Measles and Influenza present irregular trends as a result of frequent outbreaks at almost yearly intervals. Malignant Neoplasms, on the other hand, has consistently increased in incidence and mortality.

The improving picture of notifiable diseases in the Philippines is due to a host of factors. Among these maybe mentioned environmental sanitation, modern therapeutics, and advances in immunology. Of these three, improvement in environmental sanitation

made its earliest contribution; later, modern therapeutical measures including antibiotics contributed much in limiting the spread of diseases; and lately, the application of recent immunological procedures not only reduced the incidence of some communicable diseases but practically eliminated a number of them. Modern methods of control and the growing emphasis on health education, making the people aware of the hazards of diseases, also play important roles.

Figure 26 presents the trend of the death rate of communicable diseases as a group in comparison with that of Malignant Neoplasms and Diseases of the Heart from 1920 to 1966. It is shown that while the mortality rate of communicable diseases present a continuous decreasing pattern, that of Diseases of the Heart and Malignant Growths show distinctive increasing trend.

Leading Causes of Morbidity - The ten (10) leading causes of morbidity in 1966 and for the past 5 years (1961-1965) is shown in Table 13 and Figure 13. Of these diseases, 4 are broncho-pulmonary (Bronchitis, Respiratory Tuberculosis, Pneumonias and Whooping Cough); 2 are gastro-intestinal (Gastro-enteritis including Colitis and Dysenteries); 2 are viral (Influenza and Measles); 1 is nutritional (Beriberi) and 1 is parasitic (Malaria).

Bronchitis is the leading cause of morbidity not only in 1966 but also for the last 15 years (1952-1966), except in 1957 when influenza was the leading cause as a result of an epidemic of this disease in that year.

The leading causes of morbidity in the health regions, as shown in Table 14, almost approximate those for the whole country in ranks and rates. For instance, Bronchitis was the leading cause of morbidity in Regions 2, 3, 4, 5, 6, 7 and 8; while Gastro-enteritis, which caused the second highest number of morbid cases throughout the country, was the leading cause of illness in Region 1.

Seasonal Variations - The seasonal variations and expected limits of weekly incidence of selected notifiable diseases are shown in Table 17 and Figure 14. Gastro-enteritis and Colitis, Measles, Influenza, Diphtheria, Varicella and Bronchitis show definite variations of seasonal incidence.

The expected limits of the weekly number of cases were computed as follows: From the number of cases reported each sanitary calendar week for the past 5 years, 1961-1965, three central figures were selected by eliminating the highest and lowest figures reported for each week. The average of the middlemost figure (median) and the highest of the three central figures was taken as

the upper quartile limit. The resultant figures were used as the maximum limit for the expected weekly number of cases. The lower quartile limit is the arithmetic mean of the middlemost figure and the lowest of the three central figures.

Age - The age distribution of the notifiable diseases is shown in Table 15. Each disease has its particular distribution as to age. Some of them are mostly confined in the younger age groups such as Diphtheria, Whooping Cough, Meningococcal Infection, Tetanus, Yaws, Poliomyelitis, Acute Infectious Encephalitis, Measles, Varicella, Mumps, Influenza, the Pneumonias, Bronchitis, Gastroenteritis and H-Fever; a few of them, such as Respiratory Tuberculosis, Leprosy and Malignant Neoplasms are confined to the older age groups. The rest of the notifiable diseases are almost evenly distributed among the different age groups.

Sex - The sex classification of the reported cases of notifiable diseases is shown in Table 15. It is noted that there is no significant sex difference among the cases. While in some age groups the number of cases for either sex may be slightly higher than the other, yet sex does not seem to play an important role in the incidence of these diseases.

Geographical Distribution - The notifiable diseases are almost evenly distributed throughout the country with a few exceptions. Schistosomiasis, for instance, is highly endemic in Health Region 6; Filariasis is prevalent in Health Region 4; and Malaria affects mostly the hinterlands and newly opened areas of settlement.

As shown in Table 14, practically the same disease problems are present in all the eight health regions in the country.

Quarantinable Diseases - Of the six quarantinable diseases only Cholera El Tor is present in the Philippines. In 1966 there were 7,337 reported cases and 572 deaths, giving a morbidity and a mortality rate of 21.9 and 1.7 per 100,000 population respectively.

MORTALITY STATISTICS

This report presents mortality statistics based on data gathered by the field health personnel from the records of the Local Civil Registrars all over the country. These data were compiled from the statistical reports submitted monthly by all City and Municipal Health Officers to the Disease Intelligence Center.

A. GENERAL MORTALITY

There were 240,865 deaths registered in 1966. This figure represents a crude death rate of 7.2 per 1,000 population which is 4.0% more than that of the previous year (1965).

Causes of Deaths 1956 and 1966 - The ten leading causes of death in 1966 are presented in Table 24 and Figure 22. Collectively, they caused 145,466 deaths representing 60.4% of deaths from all causes. This group consists of 4 communicable diseases, all of which occupy the top 4 positions, 3 degenerative, 1 nutritional, accidents and malignant neoplasms. The first three leading causes are Pneumonias with a rate of 117.3 per 100,000 population representing 16.3% of the total deaths; Respiratory Tuberculosis with a rate of 80.8 or 11.2% of the total mortality, and Gastro-enteritis with a rate of 55.8 or 7.8% of the deaths from all causes. Bronchitis and Diseases of the Heart ranked fourth and fifth with rates of 40.8 and 31.4 respectively. Beriberi (25.3) and Diseases of the Vascular System (25.3) occupied the sixth and seventh position respectively. The last three in the group are Accidents (22.5), Malignant Neoplasms (22.1), and Nephritis together with Nephrosis with a rate of 13.2.

The leading causes of death in 1956 are shown in Table 33 and Figure 27. During that year, Pneumonias was the leading cause with a rate of 122.8 per 100,000 population and Respiratory Tuberculosis (93.8) ranked second. Beriberi with a rate of 80.9 was third; Bronchitis ranked fourth (71.1); Gastro-enteritis was fifth in line with a rate of 68.9. The sixth and seventh positions were occupied by Diseases of the Heart (34.4) and Accidents (19.1) respectively. The last three causes were Influenza (16.7); Malignant Neoplasms (9.5) and Diseases of the Vascular System with a rate of 9.5 per 100,000 population.

It is clearly observed that during the past decade, 1956 to 1966, deaths from communicable diseases, particularly some of those among the leading causes of death, showed marked decline. On the other hand, those of the chronic degenerative diseases have increased noticeably. Respiratory Tuberculosis death rate registered a decrease of 13.0 or 13.9%, while Pneumonias de-

creased by 5.5 or 4.5%. The death rate from Beriberi declined from 80.9 to 25.3 representing a decrease of 68.7%. Bronchitis and Gastro-enteritis (including colitis) rates decreased by 42.6% and 19.0% respectively. Diseases of the Heart rates declined by 8.7%. Accidents and Malignant Neoplasms showed an increase of 15.1% and 57.0% respectively. Nephritis (including Nephrosis), which was not among the 10 leading causes of death in 1956 ranked tenth in 1966. It appeared in the group for the fifth time during the past ten years.

General Mortality Trend - Table 4 and Figure 4 show the trend of the crude death rate for the country from 1920 to 1966. A marked decline in this rate from 19.2 per 1,000 population in 1920 to 7.2 in 1966 is observed. This represents a decrease of 12.0 or 62.5% over a period of 46 years. A slow and irregular decline in rate started in 1920 and continued until the outbreak of the last World War. Data on health statistics were not available during the war years. Postwar rates continued to decrease until 1964 when an all time low death rate of 6.9 was attained. The crude death rate in the country for the past 4 decades is characterized by a general downward trend with slight troughs from 1937 to 1940 and 1949 to 1952.

Crude Death Rate By Location - Of the eight health regions in the country, Region 2 registered the highest crude death rate of 10.9 per 1,000 population, while Region 7 had the lowest (4.0). The highest rate among the cities was recorded for Trece Martires (39.3) and the lowest was that of Marawi (3.1). The province of Isabela in health region 2 topped all the provinces with the high rate of 11.1 while Lanao del Sur had the lowest (1.0). A total of 28 provinces (50%) had rates equal to or higher than the national figure while 28 provinces (50%) had lower rates. There were 27 cities (65.8%) with rates higher than the national rate (7.2) and only 14 (34.2%) had lower rates.

Crude Death Rate By Month - The monthly number of deaths and the corresponding death rates for the country are shown in Table 22. The death rate for the month of January (7.3) went down to 7.1 in February, 6.6 in March and 6.7 in April. It started to go up in June and continued to rise until a peak of 8.3 was reached in the month of July. The decline, which was registered in August, continued for the succeeding months until the lowest rate was recorded in December (6.7).

Mortality By Age - Table 19 shows the deaths from all causes by age and sex and percent age distribution. The highest percentage of deaths was recorded for those under 1 year (59,818) or 23.6% of all deaths while deaths among the 15-19 years old represented the lowest percentage (1.6%).

As shown in Table 20, the age specific death rate for infants is high - 41.3 per 1,000 population. After infancy, the death rate decreased continuously as age increased, until the minimum level of 1.3 was reached in the age group 10-14 years. After this age, the rate increased again for each successive age group until a peak was reached in the age group 70 years and over, which has a specific death rate of 81.3 per 1,000 population.

Mortality By Sex - In 1966, there were 133,107 male deaths and 107,758 female deaths. These figures represent 55.3% and 44.7% of all deaths respectively. The mortality rate for males was 7.9 per 1,000 population, while that for females was 6.5. The rates for both sexes are slightly higher than that of last year (1965). The sex ratio of deaths is the same for all ages except for the age group 80 years and over, wherein the number of female deaths slightly exceeded that of the males. As in the previous years, the sex ratio is 1 male death to 0.81 female death.

B. INFANT MORTALITY

There were 59,818 deaths under 1 year of age registered in 1966. This figure represents 24.8% of all deaths. The infant mortality rate is 65.8 per 1,000 live births, which is lower than that of the previous by 3.9%. The infant mortality rate has receded to an all time low for the country in 1964 (61.5).

Infant Mortality By Cause - The ten leading causes of death under 1 year are shown in Table 42. These diseases caused 51,032 infant deaths representing 85.3% of the total infant mortality and 21.2% of the total deaths. Pneumonias, as in the previous year, caused the most number of deaths (14,590) representing a rate of 16.1 per 1,000 live births, and 24.4% of all infant deaths. Ill-defined Diseases Peculiar to Early Infancy (7.2) which was second leading cause last year retained its second position causing 6,583 deaths (11.0%). Beriberi which ranked third last year went down to the fifth position with a rate of 5.5. Bronchitis (6.3) ranked fourth in the group, while Gastro-enteritis (6.5) ranked third and caused 5,947 deaths. Immaturity (5.2) ranked sixth while Post-natal Asphyxia and Atelectasis (3.9) ranked seventh in the line. Tetanus, Nutritional Maladjustment and Congenital Malformation retained their eighth, ninth and tenth positions with rates of 2.8, 1.4 and 1.2 per 1,000 live births respectively.

Trend of Infant Mortality - The number and rate of infant deaths from 1926 to 1966 are shown in Table 4. The infant mortality rate in 1926, which was 156.7 per 1,000 live births dropped to 68.5 in 1965. This represents a marked decrease of 88.2 or 56.3%. There were slight yearly decreases in the rate from 1926 to 1939. The pre-war lowest rate recorded was in 1936 (134.0). No data were

available during the war years (1941-1945). After the war the infant death rate curve showed a regular and marked a declining trend, reaching its all time low in 1964 (61.5). The 1965 rate showed a slight increase from that of 1964 figure, while the 1966 figure (65.8) showed a slight decrease from that of 1965.

Infant Mortality By Location - Infant mortality rates for the different health regions, provinces and cities all over the country are shown in Table 5. Region 5 had the highest rate of 101.0 per 1,000 live births, while Region 3 had the lowest (56.2). Of the 56 provinces, Iloilo registered the highest rate (120.2). Sulu recorded the lowest rate (24.1). Of the cities, Roxas had the highest (220.0), while Iloilo had the lowest (33.3). Five health regions, 32 provinces and 17 cities, had rates higher than the national figure. The average infant mortality rates for provinces and cities were 69.6 and 78.4 respectively. These figures indicate a 4.7% decrease in the average provincial rate, and a 1.8% decrease in the average city rate over those of the previous year (1965).

Infant Mortality Rates By Month - Infant mortality rates by month for 1966 are shown in Table 39. A major peak in July (77.7), a minor peak in August, and a small trough in September and October, characterized the curve of the monthly rates. The rate started in January as 64.5 and decreased in February and March; it showed an irregular trend in April, May and June; and soared to its peak in July. In the succeeding months, it decreased continuously up to December when the lowest rate of 62.2 per 1,000 live births was reached.

Infant Mortality By Age - Of the total 59,818 infant deaths registered in 1966, 28,314 deaths were under 28 days (Neonatal) and 31,504 were from 28 days to under 1 year. These represented 47.3% and 52.7% of the total infant mortality respectively. Among the neonatal deaths, those that are under 1 day of age represent the highest percentage, 24.3%. Deaths under 1 day totalled 7,115 representing 11.5% of all deaths under 1 year, which is the highest in any age. The lowest number of deaths in the neonatal group occurred among those in the age group 21-27 days, which registered 1,303 deaths or 4.6% of all neonatal deaths. Of the deaths occurring after the first month of life, those of the age group 28-59 days comprised the highest percentage with 4,316 deaths representing 13.7% of the group, and 7.2% of the total infant mortality. For the successive age groups, the rates and percentage distribution were almost constant. Deaths under 28 days had a rate of 31.2 per 1,000 live births and the rate for those after 28 days of life had 34.7. These figures represent 3.7% and 3.9% decrease respectively over those of the previous year.

Infant Mortality By Sex - There were more male deaths under 1 year of age than females. The rate for males was 72.8 per 1,000 live births while that of the females was 58.3. The infant death sex

ratio is 1 male death for every .7384 female mortality. There is a greater difference in sex ratio among the neonatal deaths (male -58.5% and female -41.5%); than in the age group from 28 days to under 1 year (male -62.3%, female -37.2%).

MATERNAL MORTALITY

In 1966 there were 1,829 maternal deaths registered. This represented 7.6% of the deaths from all causes and a maternal mortality rate of 2.0 per 1,000 live births. This rate was the same as that of the previous year.

Maternal Mortality By Cause - Hemorrhages of pregnancy, childbirth, and puerperium, and other complications of pregnancy, childbirth and puerperium were the two major causes of maternal deaths, with rates of 1.2 and 0.39 per 1,000 live births, and representing 57.5% and 19.6% of all maternal deaths respectively. Sepsis of pregnancy, childbirth and puerperium with a rate of 0.13 and Toxemias of pregnancy and puerperium, with a rate of 0.23 per 1,000 live births caused 17.5% of all the maternal deaths.

Trend of Maternal Mortality - A great decline in the maternal mortality rate from 1930 to 1965 is shown in Table 4. The 1930 rate of 7.8 went down to as low as 2.0 per 1,000 live births in 1966. These represents a 74.4% decline. Pre-war maternal death rates showed a slight declining trend. This trend continued after the war until it reached 2.4 in 1960. A slight increase was observed in 1961. However, this increase was followed by noticeable drop to the all time low of 2.0 in 1965 and 1966.

Maternal Mortality By Age - The greatest percentage of maternal deaths reported was in the age group 30-34 years with a total of 419 deaths representing 22.9% of all maternal deaths. The second highest deaths reported was in the age group 25-29 years with a total of 403 deaths or 22.0% of all maternal deaths. Deaths among those in the age group 40-44 years totalled 202 (11.0%). Only 28 deaths (1.5%) in the age group 45 years and over were registered.

Maternal Mortality Rates By Month - Maternal mortality rates by month are shown in Table 53. A major peak in March, April, June and November and minor peak in July were observed. Rate for May, August, October and November is the same as that of the national rate (2.0). A consistent rate of 1.8 was registered for February, August and December. A rate of 1.9 was registered for January, July and September and the lowest rate is 1.7 for October.

Maternal Mortality By Location - Of the eight health regions, Region 6 had the highest mortality rate of 3.0 per 1,000 live births while Region 3 registered the lowest (1.3). Regions 2, 4, 5, 7,

and 8 had rates higher than the maternal figure (2.0) while, Regions 1 and 3 registered lowest rates. Of the provinces, Occ. Mindoro recorded the highest rate (6.2) and Rizal had the lowest (0.3). The highest rate among the cities was that of Calbayog City (8.4); Caloocan City registered the lowest rate (0.2).

D. FOETAL DEATHS

There were 6,166 Foetal deaths registered in 1966 representing a foetal death rate of 6.8 per 1,000 live births. This figure is 1.0 least than that of 1965 which is equivalent to a decrease of 12.8%.

Different causes of foetal deaths in the country are shown in Table 55. The leading causes by order of magnitude, are the following; Diseases of foetus and ill-defined causes with a rate of 6.2 (91.6%). Placental and Cord conditions (3.6%) and difficulties in labor (2.2%). Acute diseases in mother (0.9%) caused the least number of foetal deaths.

Foetal deaths and foetal death rates by month are shown in Table 59. The highest rate was registered in April (8.1 per 1,000 live births); the lowest was in December (5.9). From April the rate gradually decreased almost smoothly until in December it had decreased by 27.2% from its peak.

Region 3 reported the highest number of foetal deaths: 3,349 or 54.3% of all foetal mortality. Region 5 reported the least number, 177 or 2.9%. The highest regional foetal death rate recorded was in Region 3 (9.7 per 1,000 live births) and the lowest was that of Region 5 (3.0). Mindoro Oriental topped all provinces with a rate of 29.6 per 1,000 live births while, the highest city rate was recorded in Toledo City (26.3).

Foetal deaths that were medically attended totalled 1980 (32.1%) - 464 (23.4%) by private physicians; 856 (43.2%) by the Public Health Officers and 660 (33.3%) by hospital authorities. A total of 2,157 (35.0%) deaths were not given medical attendance. Attendance to 32.9% of all foetal deaths was not stated at all in the health reports.
