

## Average number of people newly diagnosed with HIV per day, selected years

## NEWLY REPORTED HIV CASES

From July to September 2020, there were 1,875 confirmed HIV-positive individuals reported to the HIV/AIDS & ART Registry of the Philippines (HARP) [Figure 1]. Twenty-one percent (393) had clinical manifestations of advanced HIV infection<sup>a</sup> at the time of testing [Table 1].

Ninety-five percent (1,783) of the reported cases were male. The median age was 28 years old (age range: 1-78 years old). More than half of the cases (52%, 981) were 25-34 years old and 27% (514) were 15-24 years old at the time of diagnosis.

**Table 1: Summary of HIV diagnoses and deaths**

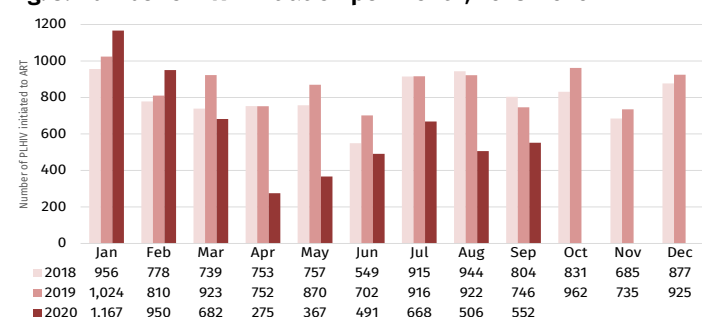

Demographic Data	Jul- Sep 2020	Jan-Sep 2020	Jan 2015- Sep 2020	Jan 1984- Sep 2020
Total reported cases	1,875	5,627	57,980	80,434
Advanced HIV infection <sup>a</sup>	393	1,134	8,357	10,399
Male	1,783	5,315	55,171	75,512 <sup>b</sup>
Female	92	312	2,809	4,911 <sup>b</sup>
Age range	1-78	1-78	1 mo-79	1 mo-82 <sup>c</sup>
Median age	28	28	28	28
Age groups: <15 y/o	7	22	169	239 <sup>c</sup>
15-24 y/o	514	1,607	17,231	23,099 <sup>c</sup>
25-34 y/o	981	2,786	29,497	40,784 <sup>c</sup>
35-49 y/o	329	1,032	9,657	14,084 <sup>c</sup>
50 y/o & above	44	180	1,426	2,155 <sup>c</sup>
Reported Pregnant	24	72	416	462
Reported deaths <sup>d</sup>	185	468	3,135	4,196

## Anti-retroviral Treatment (ART)

From July to September 2020, there were 1,726 patients who were initiated on ART [Figure 3]. The median CD4 of these patients upon enrollment was 118 cells/mm<sup>3</sup>.

A total of 45,981 people living with HIV (PLHIV) were presently on ART as of September 2020. Most (96%) were males. The age of reported cases ranged from 1 to 82 years (median: 31 years old). Ninety-five percent were on first line regimen, 4% were on second line, and 1% were on other line of regimen.

**Fig. 3: Number of ART initiation per month, 2018-2020**

Note: Due to reporting delay, data from the previous months with updated ART outcome were used for the following treatment facilities: Klinika Bernardo (Aug-Sep 2020); Angeles RHW, Atma Prema by BISDAK Inc, and Eastern Samar Provincial Hospital (Sep 2020).

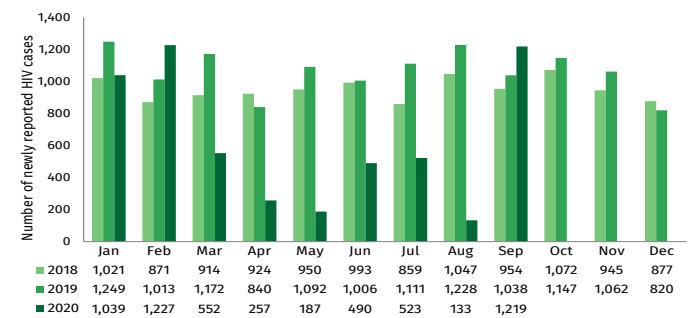

<sup>a</sup> WHO clinical stage 3 or 4

<sup>b</sup> No data on sex for 11 cases

<sup>c</sup> No data on age for 73 cases

<sup>d</sup> Reported deaths due to any cause and not necessarily AIDS-related

**Fig. 1: Number of newly reported cases per month, 2018-2020**

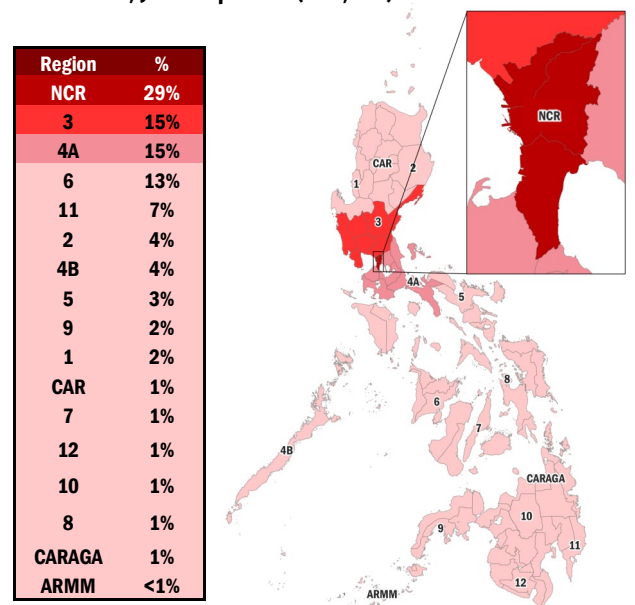

More than a quarter (29%, 553) were from the National Capital Region (NCR). Region 3 (15%, 290), Region 4A (15%, 277), Region 6 (13%, 248), and Region 11 (7%, 128) comprised the top five regions with the most number of newly reported cases for this period, together accounting for 79% of the total cases [Figure 2].

Sexual contact remained as the predominant mode of transmission (98%, 1,837). Among the newly reported cases infected through sexual contact, 65% (1,190) reported transmission through male to male sex, 22% (411) through males who have sex with both males and females, and 13% (236) were through male to female sex. Other modes of transmission were sharing of infected needles (<1%, 1) and mother-to-child transmission (<1%, 6). Thirty-one cases (2%) had no data on mode of transmission.

From July to September 2020, twenty-four were reported pregnant at the time of diagnosis. Six cases each were from NCR, Regions 3 and 4A; two cases each from Regions 5 and 6; and one case each from Regions 1 and 11.

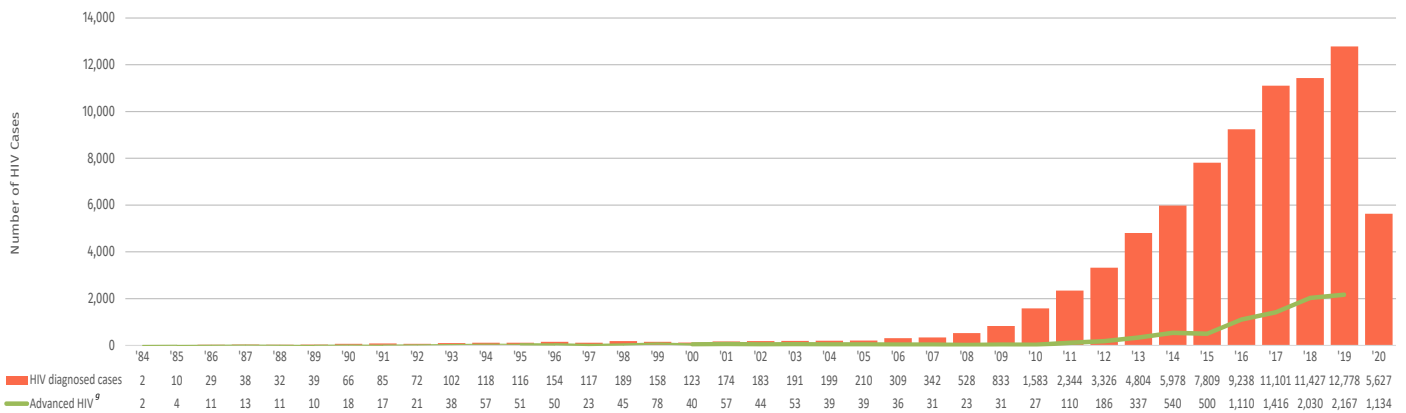

**Fig. 2: Proportion of newly reported cases by region of residence, Jul - Sep 2020 (N=1,875)**

### HIV/AIDS EPIDEMIC TRENDS IN THE PHILIPPINES (January 1984 - September 2020)

The first case of HIV infection in the Philippines was reported in 1984. Since then, there have been 80,434 confirmed HIV cases reported to the HARP. Ninety-four percent (75,512) of those diagnosed were male<sup>e</sup> and 6% (4,911) were female<sup>c</sup>. At the time of diagnosis, more than half (51%, 40,784) were 25-34 years old<sup>f</sup> while 23,099 (29%) were youth 15-24 years old<sup>f</sup>. The median age was 28 years old (age range: 1 month - 82 years). Seventy-two percent (57,980) of the total diagnosed cases in the Philippines were reported from January 2015 to September 2020. Thirteen percent (10,399) of all reported cases had clinical manifestations of advanced infection<sup>g</sup> at the time of reporting [Figure 4].

**Fig. 4: Number of HIV cases and advanced infections reported in the Philippines by year, Jan 1984 to Sep 2020 (N=80,434)**

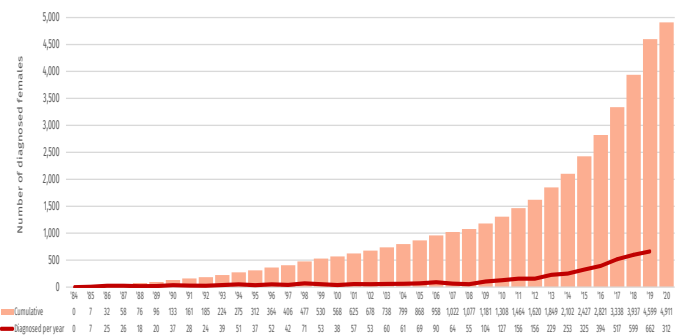

### Age and Sex

In the early years of the epidemic (1984-1990), 62% (133 of 216 cases) of those diagnosed were female. However, since 1991 the proportion of diagnosed males has been greater than that of females each year. From 1991 to present, males comprised 94% (75,429) of the 80,218<sup>e</sup> diagnosed cases in the Philippines. In addition, from January 2018 to September 2020, three percent (834) of 28,259 diagnosed cases who were assigned male at birth reported their self-identity<sup>h</sup> as female (transgender women).

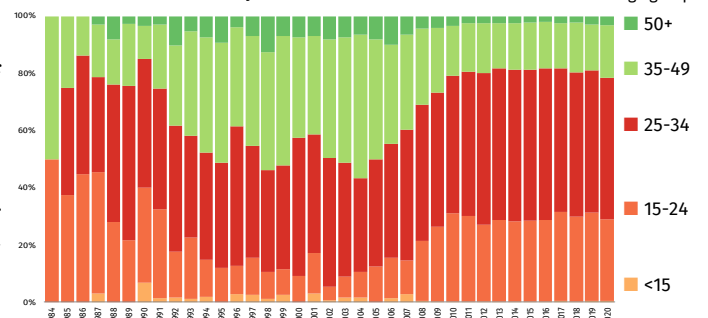

The number of diagnosed HIV infections among females has also been increasing in the past ten years (2011-2020) [Figure 5]. From January to September 2020, 312 females were diagnosed with HIV, which was three times higher compared with cases reported in 2011 (120). Ninety-two percent (4,539) of all female cases since 1984 were in the reproductive age group (15-49 years old) at the time of testing.

The predominant age group among those diagnosed has shifted to 25-34 years old starting 2006 from 35-49 years old in 2001 to 2005 [Figure 6]. Further, the proportion of HIV positive cases in the 15-24 year age group nearly doubled in the past ten years, from 17% in 2000 to 2009 to 30% in 2010 to 2019.

**Fig. 5: Number of diagnosed females per year, Jan 1984 - Sep 2020 (N=4,911)**

**Fig. 6: Proportion of HIV cases by age group, Jan 1984 - Sep 2020 (N=80,434)**

### Geographic distribution

From January 1984 to September 2020, the regions with the most number of reported cases were NCR with 30,327 (38%) cases, Region 4A with 12,321 (15%) cases, Region 3 with 7,884 (10%) cases, Region 7 with 6,823 (8%) cases, and Region 11 with 4,462 (6%) cases. Twenty-two percent (17,479) of the cases came from the rest of the country while 1,138 (1%) did not report region of residence [Table 2].

Of the 4,911 females reported with HIV, 1,282 (26%) were from NCR, 744 (15%) were from Region 3, 591 (12%) were from Region 4A, 585 (12%) were from Region 7 and 1,406 (29%) were from other regions; while 303 (6%) had no reported data on region of residence.

The regions with the most number of Overseas Filipino Workers (OFW) reported to HARP were from NCR with 2,378 (32%) cases, Region 4A with 1,302 (17%) cases, and Region 3 with 948 (13%) cases.

**Table 2: Number of HIV cases diagnosed by region of residence**

Region	Jul-Sep 2020 (N=1,875)	Jan-Sep 2020 (N=5,627)	Jan 2015 - Sep 2020 (N=57,980) <sup>i</sup>	Jan 1984 - Sep 2020 (N=80,434) <sup>j</sup>
NCR	553 (29%)	1,754 (31%)	20,269 (35%)	30,327 (38%)
4A	277 (15%)	988 (18%)	9,467 (16%)	12,321 (15%)
3	290 (15%)	770 (14%)	6,070 (11%)	7,884 (10%)
7	20 (1%)	237 (4%)	4,799 (8%)	6,823 (8%)
11	128 (7%)	280 (5%)	3,137 (5%)	4,462 (6%)
Rest of the country	607 (33%)	1,598 (28%)	14,236 (25%)	17,479 (22%)

<sup>e</sup> 11 cases had no data on sex  
<sup>f</sup> No data on age for 73 cases  
<sup>g</sup> WHO clinical stage 3 or 4

<sup>h</sup> Data on self-identity was included to HARP starting January 2018.  
<sup>i</sup> No data on region of residence for 2 (<1%) cases  
<sup>j</sup> No data on region of residence for 1,138 (1%) cases

### Modes of transmission (MOT)

From January 1984 to September 2020, sexual contact among males who have sex with males [MSM] (86%, 64,650) was the predominant MOT among diagnosed males, followed by male-female sex (11%, 7,939), and sharing of infected needles (3%, 2,197). More than half of MSM (52%, 33,775) were 25-34 years old at the time of testing, and 31% (19,965) were 15-24 years old. Among diagnosed females, male-female sex was the most common MOT (93%, 4,560) followed by sharing of infected needles (3%, 137) [Table 3].

A total of 206 children (less than 10 years old<sup>n</sup>), eight adolescents (10-19 years old<sup>n</sup>), and one adult foreigner (22 years old<sup>n</sup>) were reported to have acquired HIV through mother-to-child transmission.

From 1984 to 2006, the predominant MOT was male-female sex. From 2007, the trend shifted to sexual contact among MSM as the predominant MOT and has remained as such to the present. From January 2015 to September 2020, 84% (48,651) out of the total (57,980) diagnosed cases were among MSM.

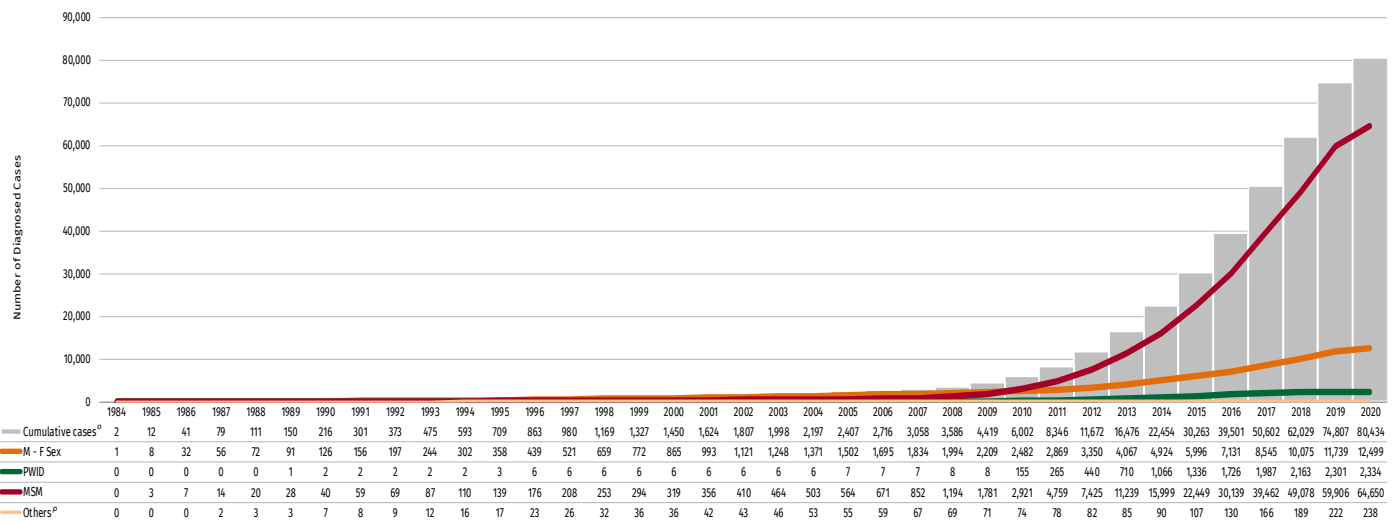

From 1984 to 2009, transmission through sharing of infected needles was less than one percent of the total cases reported. The proportion of HIV cases among people who inject drugs (PWID) increased sharply in 2010, at 9% (147) of the total cases reported that year. Further, the proportion of new cases among PWID remained at less than 6% of the total cases in the succeeding years.

Table 3: Modes of HIV transmission

Mode of Transmission	Jul-Sep 2020 (N=1,875)		Jan-Sep 2020 (N=5,627)		Jan 2015 - Sep 2020 (N=57,980)		Jan 1984 - Sep 2020 (N=80,434) <sup>l</sup>	
	M <sup>h</sup>	F <sup>k</sup>	M	F	M	F	M	F
Sexual contact	1,751	86	5,207	297	53,572	2,654	72,589	4,560
Male-female sex	150	86	463	297	4,921	2,654	7,939	4,560
Male-male sex	1,190	-	3,515	-	32,914	-	42,677	-
Sex w/ males & females <sup>m</sup>	411	-	1,229	-	15,737	-	21,973	-
Blood/blood products	0	0	0	0	0	0	5	15
Sharing of infected needles	1	0	31	2	1,203	65	2,197	137
Needlestick injury	0	0	0	0	0	0	2	1
Mother-to-child	2	4	6	10	75	73	111	104
No data	29	2	71	3	321	17	608	94

Regional patterns vary across different MOT. Forty percent (26,120) of ever diagnosed males who have sex with males were from NCR; almost all (99%) reported cases among people who inject drugs were from Region 7; and 31% (94) of females who engaged in transactional sex were from Region 3.

Fig. 7: Cumulative number of diagnosed per year by MOT, Jan 1984 - Sep 2020 (N=80,434)

### SPECIFIC POPULATIONS

#### Youth (15-24 years old)

From July to September 2020, 514 (27%) cases were among youth 15-24 years old and 95% were male. Almost all (99%, 507) were infected through sexual contact (57 male-female sex, 334 male-male sex, 116 sex with both males & females<sup>m</sup>). Seven (1%) had no data on the MOT.

From January 1984 to September 2020, 23,099 (29%) of the reported cases were 15-24 years old. Ninety-seven percent (22,461) were infected through sexual contact (2,496 male-female sex, 13,630 male-male sex, 6,335 sex with both males & females<sup>m</sup>), 479 (2%) were infected through sharing of needles, one (<1%) was infected through mother-to-child transmission, and 158 (1%) had no data on the MOT. Seventy-seven percent (17,231 out of 22,461) of all those 15-24 years old at the time of testing were diagnosed from January 2015 to September 2020. Since 2004, more males were diagnosed from this age group. However, the number of diagnosed HIV cases among female youth had increased significantly in the past five years. The total diagnosed females aged 15-24 years old in January to September 2020 (92) was 37% higher compared with the same reporting period (67) in 2015.

<sup>h</sup> Sex at birth; M= Male, F = Female  
<sup>i</sup> No data on MOT and sex for 11 cases  
<sup>m</sup> Among males only

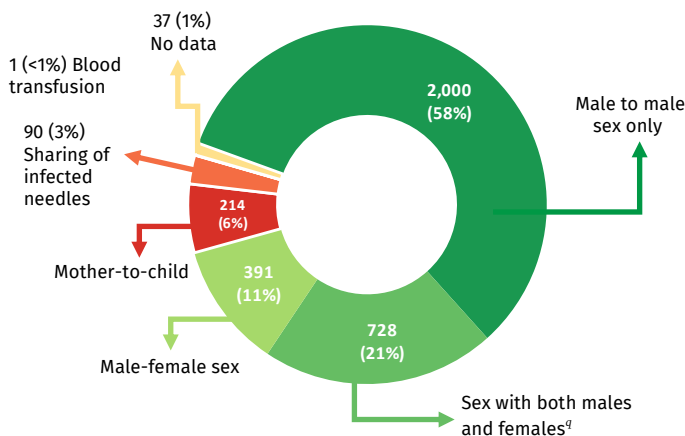

<sup>n</sup> Age was based at the time of testing  
<sup>o</sup> Cumulative HIV cases include reported deaths and 713 cases with no data on MOT, Jan 1984-Sep 2020  
<sup>p</sup> Others include the following MOT: needle prick injury, blood/blood products, and mother-to-child transmission

### Children (<10) & Adolescents (10-19)

From July to September 2020, there were 58 newly reported adolescents. Of these, fifteen were 15-17 years old and 43 were 18-19 years old. Ninety-eight percent (57) were infected through sexual contact (35 male-male sex, 15 had sex with both males & females<sup>q</sup> and 7 male to female). Further, seven children were reported with HIV in this reporting period, six were infected through mother-to-child transmission and one had no data on MOT.

Four percent (3,461) of all diagnosed cases from January 1984 to September 2020 were 19 years old and younger at the time of diagnosis. Of these, six percent (212) were children less than 10 years old. Among the children, 206 (97%) were infected through mother-to-child transmission; one (<1%) through blood transfusion; and five (2%) had no data on MOT. Further, 94% (3,249) were adolescents. Twenty-seven were 10-14 years old, 480 were 15-17 years old and 2,742 were 18-19 years old. Of the adolescents, 96% (3,119) were infected through sexual contact (391 male-female sex, 2,000 male-male sex, and 728 sex with both males & females<sup>q</sup>), 90 (3%) were infected through sharing of infected needles, 8 (<1%) through mother-to-child transmission, and 32 (1%) had no data on MOT.

Fig. 8: MOT among children and adolescents, Jan 1984 - Sep 2020 (N=3,461)

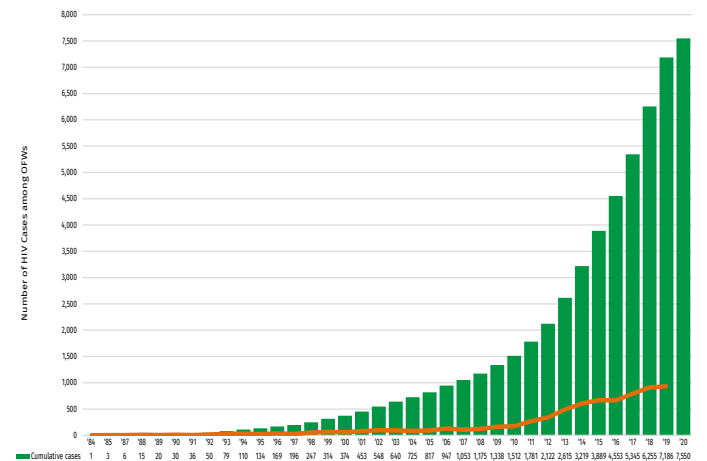

### Overseas Filipino Workers (OFW)

One hundred fourteen Filipinos who worked overseas within the past five years, whether on land or at sea, were newly reported from July to September 2020. They comprised 6% of the total cases for this period. Of these, 89% (102) were male. Further, 98% (100) of male cases were infected through sexual contact (11 male-female sex, 59 male-male sex, and 30 sex with both males and females<sup>q</sup>). The ages of male OFWs ranged from 23 to 78 years (median: 33 years). Half (50%, 51) of the male cases were 25-34 years old at the time of testing and 34% (35) were 35-49 years old. All of the 12 female OFWs were infected through male-female sex. More than half (58%, 7) were 35-49 years older at the time of testing and 33% (4) were 25-34 years old. The age range among diagnosed female OFWs were from 27 to 51 years (median: 40 years old).

From January 1984 to September 2020, nine percent (7,550) of the total cases were OFWs [Figure 9]. Of these, 6,562 (87%) were male. Almost all (99%, 6,482) of male cases were infected through sexual contact (1,631 male-female sex, 2,890 male-male sex and 1,961 sex with both males and females<sup>q</sup>). The ages of male OFWs ranged from 16 to 80 years (median: 32 years). Among 988 female OFWs, 97% (961) were infected through male-female sexual contact. The ages of female OFWs ranged from 20 to 73 years (median: 34 years old).

Fig. 9: Number of reported OFW diagnosed with HIV, Jan 1984 - Sep 2020 (N=7,550)

### People who engage in transactional sex

People who engage in transactional sex are those who reported that they either pay for sex, regularly accept payment for sex, or do both. Reporting of transactional sex was included in the HARP starting December 2012.

From July to September 2020, 12% (229) of the newly reported cases engaged in transactional sex [Table 4]. Ninety-eight percent (224) were male and aged from 17 to 75 years old (median: 31 years). Fifty-six percent (126) of the males reported paying for sex only, 26% (58) reported accepting payment for sex only and 18% (40) engaged in both. Further, all of the five female cases who engaged in transactional sex were reported to have accepted payment for sex only [Table 4].

A total of 8,440 cases reported to HARP from December 2012 to September 2020 were people who engaged in transactional sex. Ninety-six percent (8,136) were male. There were 4,538 (54%) who only paid for sex, 2,657 (31%) who only accepted payment for sex, and 1,245 (15%) who engaged in both [Table 4].

Table 4: Age and sex of people diagnosed with HIV who engaged in transactional sex

Type of Transactional Sex	Jul-Sep 2020 (N=229)	Jan-Sep 2020 (N=705)	Dec 2012- Sep 2020 (N=8,440)
Accepted payment for sex only:	63 (28%)	196 (28%)	2,657 (31%)
Male	58	187	2,467
Female	5	9	190
Age Range (Median)	17-55 (28)	16-55 (27)	12-68 (26)
Paid for sex only:	126 (55%)	407 (58%)	4,538 (54%)
Male	126	406	4,512
Female	0	1	26
Age Range (Median)	19-75 (33)	18-77 (33)	13-79 (31)
Engaged in both:	40 (17%)	102 (14%)	1,245(15%)
Male	40	102	1,157
Female	0	0	88
Age Range (Median)	19-53 (30)	18-57 (30)	15-62 (29)

<sup>q</sup> Among males only

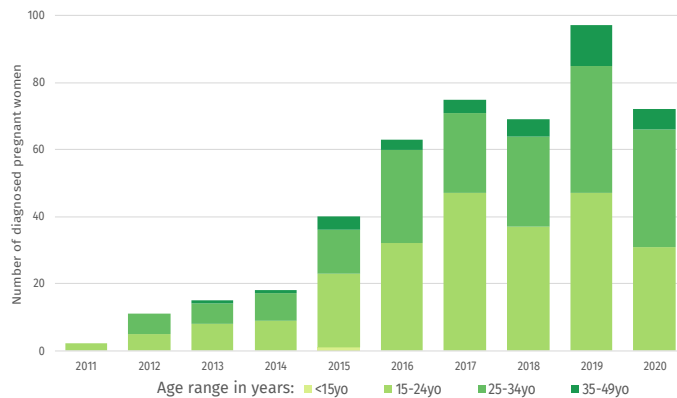

## Pregnant women living with HIV

Reporting of pregnancy status at the time of diagnosis was included in the HARP starting year 2011.

From January to September 2020, there were 72 HIV positive women reported pregnant at the time of diagnosis. Of these, 35% (25) were from NCR, 19% (14) were from Region 4A, 18% (13) were from Region 3 and 28% (20) were from the rest of the country. The age of diagnosis ranged from 15 to 41 years old (median age: 25).

Since 2011, a total of 462 diagnosed women were reported pregnant at the time of diagnosis. More than half (52%, 240) were 15-24 years old at the time of diagnosis, and 40% (185) were 25-34 years old [Figure 10]. The regions with highest number of diagnosed pregnant cases with HIV were NCR (45%, 207), Region 7 (19%, 88), Region 4A (11%, 51), and Region 3 (8%, 37).

**Fig. 10: Number of HIV positive women who were pregnant at the time of diagnosis by age group, Jan 2011 - Sep 2020 (N=462)**

## DEATHS AMONG PEOPLE WITH HIV

From July to September 2020, there were 185<sup>r</sup> reported deaths due to any cause among people with HIV. Ninety-five percent (175) were males [Table 5]. Two cases (1%) were less than 15 years old at the time of death, 25 (13%) cases were 15-24 years old, 96 (52%) were 25-34 years old, 51 (28%) were 35-49 years old and 11 (6%) were 50 years and older. Ninety-four percent of the cases were reported to have acquired the infection through sexual contact (25 through sex with male and female, 107 through male-male sex, 43 through sex with both males and females<sup>s</sup>). Three (2%) were infected through sharing of needles and one (<1%) was infected through mother-to-child transmission. Six (3%) of the reported deaths had no data on MOT.

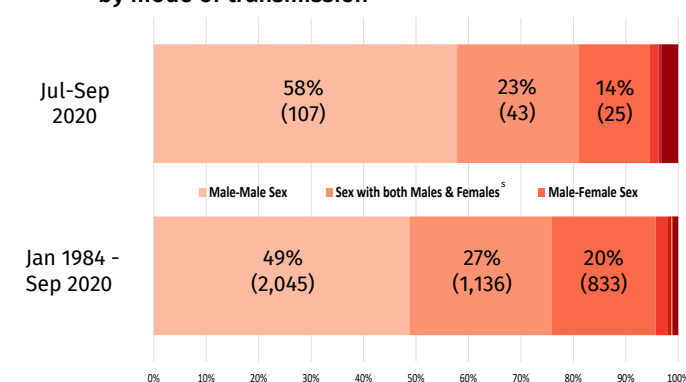

A total of 4,196 deaths were reported from January 1984 to September 2020, and 92% (3,852) of whom were male. Twenty-eight (1%) were less than 15 years old at the time of death, 627 (15%) were 15-24 years old, 2,115 (50%) were 25-34 years old, 1,175 (28%) were 35-49 years old, and 249 (6%) were 50 years and older [Table 5]<sup>r</sup>.

Sexual contact (96%) was the most common mode of HIV transmission among reported deaths (833 through male-female sex, 2,045 through male-male sex, 1,136 through sex with both males and females<sup>s</sup>). Other modes of transmission of reported deaths were sharing of infected needles (2%, 100), mother-to-child transmission (1%, 27), and blood transfusion (<1%, 9) [Figure 11]<sup>u</sup>.

**Table 5: Demographic data of reported deaths among people with HIV**

Demographic Data	Jul-Sep 2020	Jan-Sep 2020	Jan 1984 - Sep 2020
Total reported deaths	185 <sup>r</sup>	468	4,196
Male	175	446	3,852
Female	10	22	344
Age group: <15 y/o	2	3	28 <sup>t</sup>
15-24 y/o	25	61	627 <sup>t</sup>
25-34 y/o	96	254	2,115 <sup>t</sup>

Surveillance Officer

### HIV/AIDS & ART Registry of the Philippines (HARP)

The HARP is the official record of total number of diagnoses (laboratory-confirmed), ART outcome status and deaths among people with HIV in the Philippines.

All individuals in the registry are confirmed by the San Lazaro Hospital STD/AIDS Cooperative Central Laboratory (SACCL) which is the HIV/AIDS National Reference Laboratory (NRL) and DOH Certified Rapid HIV Confirmatory Laboratories (CrCLs). Confirmed HIV positive individuals were reported to the DOH-Epidemiology Bureau (EB) and recorded to HARP.

ART figures are counts of HIV positive adult and pediatric patients currently enrolled and accessing Antiretroviral (ARV) medication during the reporting period in 743 treatment hubs and primary HIV care treatment facilities that had reported in the HARP. This report did not include patients who have previously taken ARV but have died, left the country, have been lost to follow-up and/or opted not to take ARV. Lost to follow-up is considered once a person have failed to visit a treatment facility more than 3 months after the expected date of ARV refill.

HARP is a passive surveillance system. Except for HIV confirmation by the NRL & CrCLs, all other data submitted to the HARP are secondary and cannot be verified. Hence, HARP cannot determine if an individual's reported place of residence is where the person got infected, or where the person lived after being infected, or where the person is presently living. This limitation has major implications on data interpretation. Readers are advised to interpret the data with caution and consider other sources of information before arriving at conclusions.
