

HIV/AIDS & ART REGISTRY OF THE PHILIPPINES

Average number of people newly diagnosed with HIV per day, selected years

NEWLY DIAGNOSED CASES

In March 2021, there were 1,041 confirmed HIV-positive individuals reported to the HIV/AIDS & ART Registry of the Philippines (HARP) [Figure 1]. Fifteen percent (156) had clinical manifestations of advanced HIV infection^a at the time of testing [Table 1].

Ninety-five percent (991) of the reported cases were male. The median age was 28 years old (age range: 6-65 years old). More than half of the cases (52% or 538) were 25-34 years old and 30% (316) were 15-24 years old at the time of diagnosis.

Eighteen percent (192) were from Region 6. National Capital Region (NCR) (18%, 184), Region 11 (18%, 183), Region 4A (12%, 123), and Region 3 (10%, 105) comprised the top five regions with the most number of newly reported cases for this reporting period, together accounting for 76% of the total cases [Figure 2].

Sexual contact remained as the predominant mode of transmission (97%, 1,013). Among the newly reported cases who acquired HIV through sexual contact, 63% (656) were through male to male sex, 25% (261) through males who have sex with both males and females^d, and 9% (96) through male to female sex. Further, 9 (1%) were infected through sharing of infected needles and 19 cases (2%) had no data on mode of transmission.

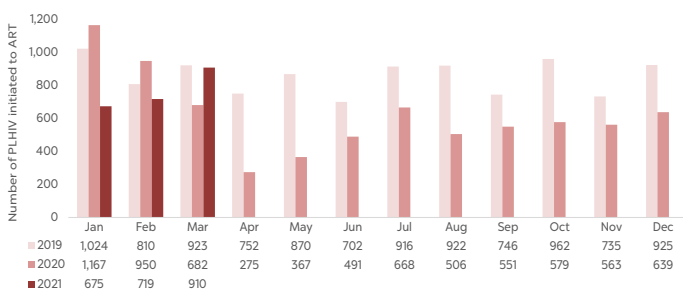

In March 2021, six cases were reported pregnant at the time of diagnosis. Two cases each from Regions 3 and 11, and one case each from Region 4A and NCR.

Anti-retroviral Therapy

In March 2021, there were 910 people with HIV who were initiated on ART [Figure 3]. The median CD4 of these patients upon enrollment was at 208 cells/mm³.

A total of 50,140 people living with HIV (PLHIV) were presently on ART as of March 2021. Ninety-six percent (48,235) were males. The age of reported cases ranged from 1 to 80 years (median: 32 years old). Ninety-five percent were on the first line regimen, 4% were on second the line, and 1% were on the third line of regimen.

Fig. 3: Number of ART initiation per month, 2019-2021

Note:
Due to reporting delay, data from previous month (Feb 2021) were used for Bernardo SHC and Eversley Sanatorium in updating their treatment outcome for this reporting period.

^a WHO clinical stage 3 or 4
^b No data on sex for 11 cases
^c No data on age for 73 cases
^d Among males only (sex assigned at birth)
^e Reported deaths due to any cause and not necessarily AIDS-related

Note:
HIV confirmed cases of previous reporting months from Davao RHWC (Region 11) (01, Jan 2020-Feb 2021) and Corazon Locsin Montelibano Memorial Regional Hospital (Region 6) (76, Nov 2020-Feb 2021) were included in the March 2021 HARP report due to delayed submission.

EPIDEMIC TRENDS OF HIV/AIDS IN THE PHILIPPINES, JAN 1984 - MAR 2021

The first case of HIV infection in the Philippines was reported in 1984. Since then, there have been 85,651 confirmed HIV cases reported to the HARP. Ninety-four percent (80,468) of those diagnosed were male^f and 6% (5,172) were female^f. At the time of diagnosis, more than half (51%, 43,503) were 25–34 years old^g while 24,530 (29%) were youth (15–24 years old^g). The median age was 28 years old (age range: 1 month - 82 years). Thirteen percent (11,363) of the reported cases had clinical manifestations of advanced infection^h at the time of testing. Moreover, 65% (55,388) of the total diagnosed cases in the Philippines were reported from January 2016 to March 2021.

Fig. 4: Number of HIV cases and advanced infections reported in the Philippines by year, Jan 1984 to Mar 2021 (N=85,651)

Sex and Age

In the early years of the epidemic (1984–1990), 62% (133 of 216 cases) of those diagnosed were female. However, since 1991 the proportion of diagnosed males has been greater than that of females each year. In the past 10 years (2011–2021), proportion of yearly diagnosed cases among males were more than 93%.

The number of diagnosed HIV infections among females has also been increasing in the past ten years (2011–2021) [Figure 5]. From January to March 2021, 139 females were diagnosed with HIV, which was almost twice higher compared with cases reported in 2016 (82). Ninety-two percent (4,777) of all female cases since 1984 were in the reproductive age group (15–49 years old) at the time of testing.

The predominant age group among those diagnosed has shifted to 25–34 years old starting 2006 from 35–49 years old in 2001 to 2005 [Figure 6]. Further, the proportion of HIV positive cases in the 15–24 year age group increased in the past 10 years, from 22% in 2001 to 29% in 2020.

Fig. 5: Number of diagnosed females per year, Jan 1984 to Mar 2021 (n=5,172)

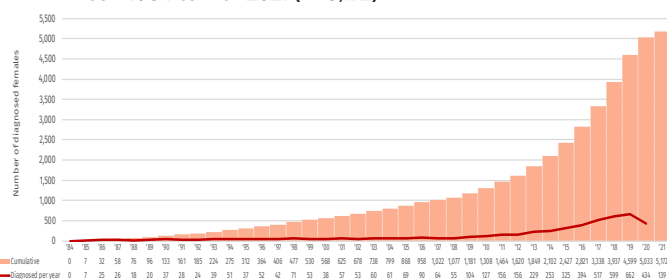

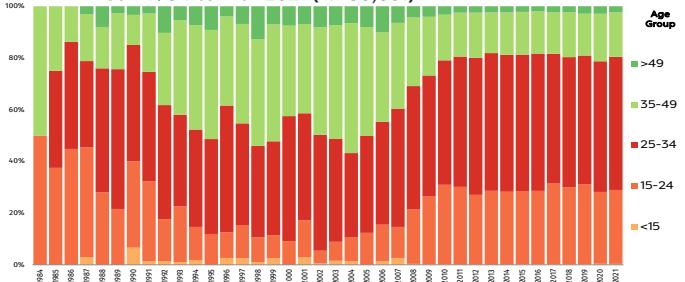

Fig. 6: Proportion of HIV cases by age group, Jan 1984 to Mar 2021 (N=85,651)^e

Geographic Distribution

From January 1984 to March 2021, the regions with the most number of reported cases were NCR with 31,875 (37%) cases, Region 4A with 13,179 (15%) cases, Region 3 with 8,496 (10%) cases, Region 7 with 7,328 (9%) cases, and Region 6 with 4,747 (6%) cases. Twenty-two percent (18,888) of the cases came from the rest of the country while 1,138 (1%) did not report region of residence [Table 2].

Of the 5,172 females reported with HIV, 1,343 (26%) were from NCR, 790 (15%) were from Region 3, 640 (12%) were from Region 4A, and 626 (12%) were from Region 7. Furthermore, 1,470 (29%) were from other regions; while 303 (6%) had no reported data on region of residence.

The regions with the most number of Overseas Filipino Workers (OFW) reported to HARP were from NCR with 2,462 (31%) cases, Region 4A with 1,381 (17%) cases, and Region 3 with 1,005 (13%) cases.

Table 2: Number of HIV cases diagnosed by region of residence

Region	Mar 2021 (N=1,041)	Jan-Mar 2021 (N=2,786)	Jan 2016-Mar 2021 (N=55,388)	Jan 1984-Mar 2021 (N=85,651) ⁱ

^h WHO clinical stage 3 or 4

ⁱ No data on region of residence for 1,138 (1%) cases

Modes of Transmission (MOT)

From January 1984 to March 2021, sexual contact among males who have sex with males [MSM] (86%, 69,057) was the predominant MOT, followed by male-female sex (10%, 8,300), and sharing of infected needles (3%, 2,259). More than half of MSM (52%, 36,136) were 25-34 years old at the time of testing, and 31% (21,245) were 15-24 years old. Among diagnosed females, male-female sex was the most common MOT (93%, 4,806) followed by sharing of infected needles (3%, 140) [Table 3].

A total of 219 children (less than 10 years old^m), eight adolescents (10-19 years old^l), and one adult foreigner (22 years old^m) were reported to have acquired HIV through mother-to-child transmission.

From 1984 to 2006, the most common MOT (62%, 1,695) was male-female sex. From 2007, the trend shifted to sexual contact among MSM as the predominant MOT and has remained as such to the present. From January 2016 to March 2021, 84% (46,608) out of the total (55,388) diagnosed cases were among MSM.

From 1984 to 2009, transmission through sharing of infected needles was less than one percent of the total cases reported. In 2010, 9% (147) of the total cases (1,583) reported were among people who inject drugs (PWID). However, the proportion of new cases among PWID remained at less than 6% of the total cases in the succeeding years.

Table 3: Modes of HIV Transmission

Mode of Transmission	Mar 2021 (N=1,041)		Jan-Mar 2021 (N=2,786)		Jan 2016-Mar 2021 (N=55,388)		Jan 1984-Mar 2021 (N=85,651) ^k	
	M ⁱ (991)	F ^j (50)	M (2,647)	F (139)	M (52,643)	F (2,745)	M (80,468)	F (5,172)
Sexual Contact	966	47	2,569	131	51,121	2,597	77,357	4,806
Male-female sex	49	47	179	131	4,513	2,597	8,300	4,806
Male-male sex	656	-	1,674	-	32,124	-	45,769	-
Sex w/ males & females ^l	261	-	716	-	14,484	-	23,288	-
Blood /blood products	0	0	0	0	0	0	5	15
Sharing of infected needles	8	1	16	1	1,009	54	2,259	140
Needlestick injury	0	0	0	0	0	0	2	1
Mother-to-child	0	0	2	4	74	71	118	110
No data	17	2	60	3	439	23	726	100

Regional patterns vary across different MOT. Forty percent (27,475) of ever diagnosed males who have sex with males were from NCR; almost all (99%, 2,392) reported cases among people who inject drugs were from Region 7; and 31% (97) of females who engaged in transactional sex were from Region 3.

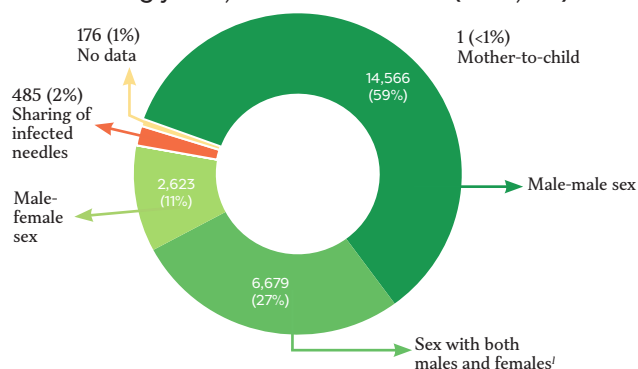

SPECIFIC POPULATION

Youth (15-24 years old)

In March 2021, 316 (30%) cases were among youth 15-24 years old and 95% were male. Almost all (99%, 312) were infected through sexual contact (25 male-female sex, 222 male-male sex, 65 sex with both males & females^k) and one (<1%) was infected through sharing of infected needles. Three (1%) cases had no data on the MOT.

From January 1984 to March 2021, 24,530 (29%) of the reported cases were 15-24 years old. Ninety-seven percent (23,868) were infected through sexual contact (2,623 male-female sex, 14,566 male-male sex, 6,679 sex with both males & females^l), 485 (2%) were infected through sharing of needles, one (<1%) was infected through mother-to-child transmission, and 176 (1%) had no data on the MOT. Sixty-seven percent (16,451 out of 24,530) of all those 15-24 years old at the time of testing were diagnosed from January 2016 to March 2021. Since 2004, more males were diagnosed from this age group. However, the number of diagnosed HIV cases among female youth had increased significantly in the past five years. The total diagnosed females aged 15-24 years old in January to March 2021 (37) was almost three times higher compared with the same reporting period (14) in 2016 [Figure 7].

Fig. 7: MOT among youth, Jan 1984 - Mar 2021 (n=24,530)

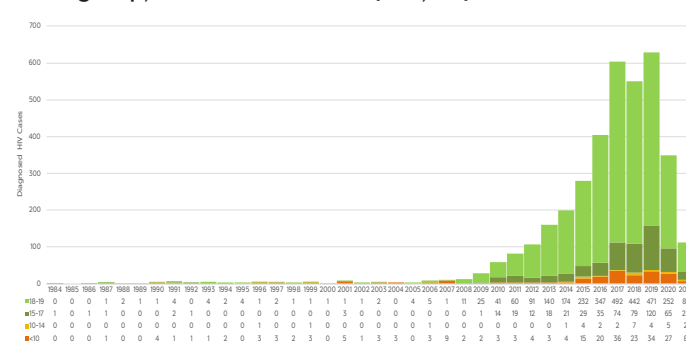

Children (<10) & Adolescents (10-19)

In March 2021, there were 43 newly reported adolescents. Of these, 26% (11) were 15-17 years old, and 74% (32) were 18-19 years old. All adolescents were infected through sexual contact (5 male-female sex, 30 male-male sex, 8 sex with both males & females^l). Further, one child was diagnosed with HIV in this reporting period and had no data on MOT.

Four percent (3,675) of all diagnosed cases from January 1984 to March 2021 were 19 years old and younger at the time of diagnosis. Among the total, 229 (6%) were less than 10 years old at the time of testing, 30 (1%) were 10-14 years old, 518 (14%) were 15-17 years old, and 2,898 (79%) were 18-19 years old. [Figure 8]

Further, in the past 5 years since 2019, significant increase of cases among age groups 15-17 and 18-19 were notable. Diagnosed cases in 2019 (120) among 15-17 years old were six times higher compared to 2014 (21) while 18-19 years old were three times higher in comparison of the same reporting period of 2019 (417) and 2014 (174).

Fig. 8: Diagnosed cases among children and adolescents by age group, Jan 1984 - Mar 2021 (n=3,675)

ⁱ Sex at birth: M=Male, F=Female
^k No data on MOT and sex for 11 cases
^l Among males only
^m Age was based at the time of testing

Transgender Women (TGW)ⁿ

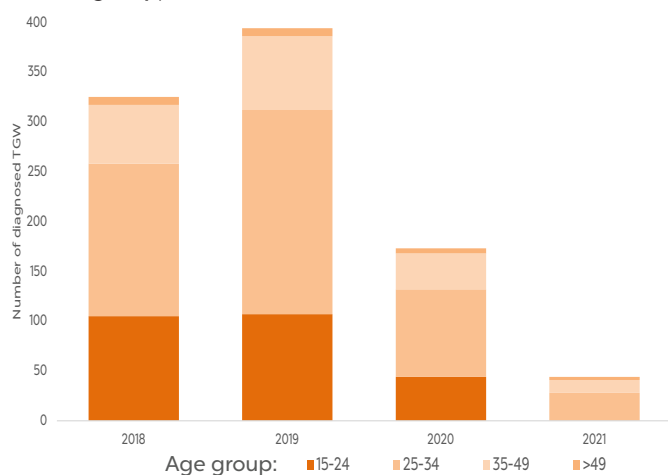

Reporting of gender identity was included in the HARP starting year 2018. TGW were male cases (sex assigned at birth) who reported their gender identity as female at the time of testing.

In March 2021, there were 14 TGW diagnosed with HIV. Of these, more than half (57%, 8) were 25–34 years old, 29% (4) 35–49 years old, 7% (1) 15–24 years old and 7% (1) were 50 years and older. The age of diagnosis ranged from 24 to 51 (median: 33).

A total of 949 TGW were diagnosed from January 2018 to March 2021. Almost all (90%, 940) of the cases acquired HIV through sexual contact (7 male^o-female, 840 male^o-male, 93 sex with both males and females) and less than 1% (3) through sharing of infected needles. Six (1%) TGW had no data on MOT.

Further, half (50%, 474) of the TGW were 25–34 years old at the time of testing, 28% (269) were 15–24 years old, 19% (182) were 35–49 years old, and 3% (24) were 50 years and older. The median age of diagnosis was 28 years old (age range: 15 to 63 years old) [Figure 9].

Fig. 9: Number of reported TGW diagnosed with HIV by age group, Jan 2018 - Mar 2021 (n=949)

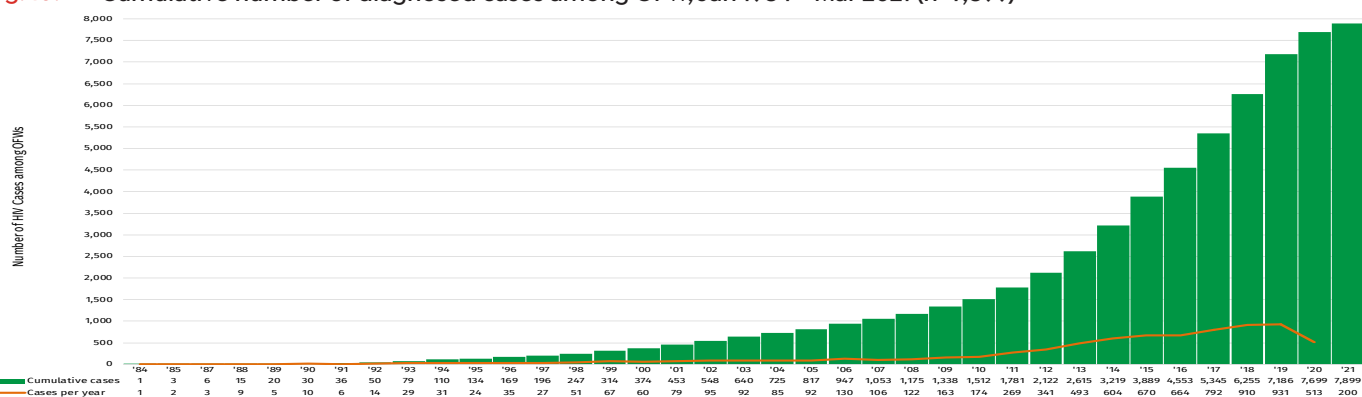

Overseas Filipino Workers

Sixty-two Filipinos who worked overseas within the past five years, whether on land or at sea, were newly reported in March 2021. They comprised 6% of the total cases for this period. Of these 89% (55) were male. Further, 98% (54) of the male cases were infected through sexual contact (7 male-female sex, 27 male-male sex, and 20 sex with both males and females^p). The ages of male OFWs ranged from 22 to 65 years (median: 33 years). More than half (54%, 30) of the male cases were 25–34 years old at the time of testing, 31% (17) were 35–49 years old, 11% (6) were 50 years & older, and 4% (2) were 15–24 years old. Eighty-six percent (6) of the female OFWs were infected through sexual contact and one (14%) female OFW had no data on MOT. More than half (57%, 4) of the female cases were 25–34 years old, 29% (2) were 50 years & older, and 14% (1) were 35–49 years old. The age range among diagnosed female OFWs were from 31 to 60 years old (median: 33 years old).

From January 1984 to March 2021, 9% (7,899) of the total cases were OFWs [Figure 10]. Of these, 6,878 (87%) were male. Almost all (99%, 6,786) of male cases were infected through sexual contact (1,671 male-female sex, 3,047 male-male sex and 2,068 sex with both males and females^p). The ages of male OFWs ranged from 16 to 80 years (median: 32 years). Among 1,021 female OFWs, 97% (993) were infected through sexual contact. The ages of female OFWs ranged from 20 to 73 years old (median: 35 years old).

Fig. 10: Cumulative number of diagnosed cases among OFW, Jan 1984 - Mar 2021 (n=7,899)

ⁿ Of the total 33,215 male (sex at birth) cases in Jan 2018-Mar 2021, 31% (10,259) had no data on self-identity
^o Male (sex assigned at birth)
^p Among males only

Transactional Sex

People who engage in transactional sex are those who reported that they either pay for sex, regularly accept payment for sex, or do both. Reporting of transactional sex was included in the HARP starting December 2012.

In March 2021, 14% (144) of the newly diagnosed engaged in transactional sex [Table 4]. Ninety-nine percent (143) were male. They were aged from 18 to 59 years old (median: 29 years old). Thirty-one percent (45) of the males reported paying for sex only, 61% (87) reported accepting payment for sex only and 8% (11) engaged in both. One female case aged 39 years old was reported to have accepted payment for sex only.

A total of 9,040 cases reported to HARP from December 2012 to March 2021 were people who engaged in transactional sex. Ninety-seven percent (8,732) were male. There were 4,871 (54%) who paid for sex, 2,835 (31%) who accepted payment for sex, and 1,334 (15%) who engaged in both [Table 4].

Table 4: Age and sex of people diagnosed with HIV who engaged in transactional sex

Type of Transactional Sex	Mar 2021 (N=144)	Jan-Mar 2021 (N=316)	Jan 2016-Mar 2021 (N=6,512)	Dec 2012-Mar 2021 (N=9,040)

Age Range (Median)	21-55 (29)	20-55 (31)	15-62 (29)	15-62 (29)

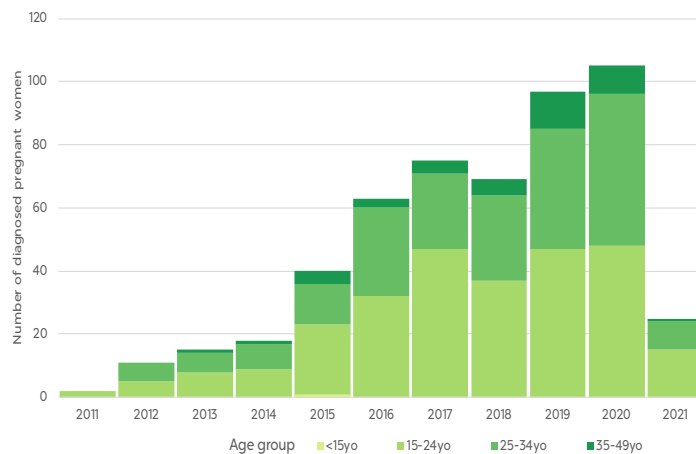

Pregnant Women with HIV

Reporting of pregnancy status at the time of diagnosis was included in the HARP starting year 2011.

From January to March 2021, there were 25 HIV positive women reported pregnant at the time of diagnosis. Of these, 28% (7) each were from NCR and Region 3, 16% (4) were from Region 4A, 12% (3) were from Region 7 and 16% (4) were from the rest of the country. The age of diagnosis ranged from 15 to 36 years old (median age: 23).

Since 2011, a total of 520 diagnosed women were reported pregnant at the time of diagnosis. More than half (52%, 272) were 15-24 years old at the time of diagnosis and 40% (207) were 25-34 years old [Figure 11]. The regions with highest number of diagnosed pregnant cases with HIV were NCR (43%, 226), Region 7 (19%, 99), Region 4A (12%, 61), Region 3 (9%, 48), and Region 11 (4%, 19).

Fig. 11: Number of HIV positive women who were pregnant at the time of diagnosis by age group, Jan 2011 - Mar 2021 (n=520)

Mortality

In March 2021, there were 68^g reported deaths due to any cause among people with HIV. Ninety-three percent (63) were males. One case (<1%) was less than 15 years old, 8 (12%) cases were 15-24 years old, 33 (49%) were 25-34 years old, 18 (26%) were 35-49 years old and 8 (12%) were 50 years and older [Figure 12]. The top 5 regions with the most number of reported deaths were National Capital Region (NCR) (40%, 27), Region 4A (22%, 15), Region 3 (13%, 9), Region 6 (7%, 5), and Region 4B (4%, 3). Two cases each were from Regions 10, 12, and 5. One case each from Regions 1, 11, and 7.

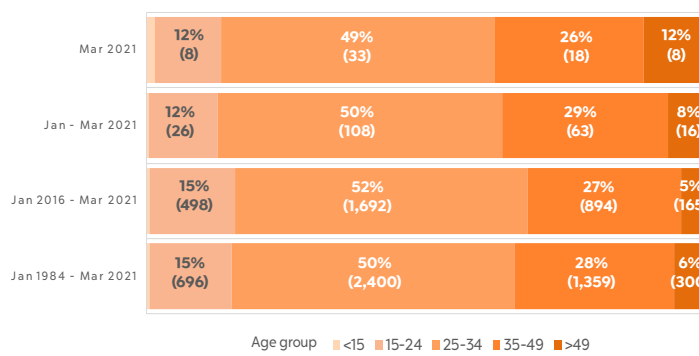

A total of 4,787 deaths were reported from January 1984 to March 2021, and 92% (4,413) of whom were male. Thirty (1%) were less than 15 years old^r at the time of death, 696 (15%) were 15-24 years old^r, 2,400 (50%) were 25-34 years old^r, 1,359 (28%) were 35-49 years old^r, and 300 (6%) were 50 years and older^r [Figure 12].

From 1984 to March 2021, the top 5 regions with the most number of reported deaths were NCR (31%, 1,487), Region 4A (13%, 647), Region 3 (11%, 522), Region 6 (10%, 475), and Region 7 (7%, 338). Further, 134 (3%) cases had no data on region of residence [Table 5].

Table 5: Proportion of reported deaths by region of residence

Region	Mar 2021 (N=68)	Jan-Mar 2021 (N=214) ^s	Jan 2016-Mar 2021 (N=3,265) ^t	Jan 1984-Mar 2021 (N=4,787) ^u

HIV/AIDS & ART REGISTRY OF THE PHILIPPINES

The HARP is the official record of total number of diagnoses (laboratory-confirmed), ART outcome status and deaths among people with HIV in the Philippines. All individuals in the registry are confirmed by the San Lazaro Hospital STD/AIDS Cooperative Central Laboratory (SACCL) which is the HIV/AIDS National Reference Laboratory (NRL) and DOH Certified Rapid HIV Diagnostic Algorithm - rHIVida Confirmatory Laboratories (CrCLs). Confirmed HIV positive individuals were reported to the DOH-Epidemiology Bureau (EB) and recorded to HARP. ART figures are counts of HIV positive adult and pediatric patients currently enrolled and accessing Antiretroviral (ARV) medication during the reporting period in 158 treatment hubs and primary HIV care treatment facilities that had reported in the HARP. This report did not include patients who have previously taken ARV but have died, left the country, have been lost to follow-up and/or opted not to take ARV. Lost to follow-up is considered once a person has failed to visit a treatment facility more than 3 months after the expected date of ARV refill.

HARP is a passive surveillance system. Except for HIV confirmation by the NRL & CrCLs, all other data submitted to the HARP are secondary and cannot be verified. Hence, HARP cannot determine if an individual's reported place of residence is where the person got infected, or where the person lived after being infected, or where the person is presently living. This limitation has major implications on data interpretation. Readers are advised to interpret the data with caution and consider other sources of information before arriving at conclusions.

HIV/AIDS & ART REGISTRY OF THE PHILIPPINES

FACILITIES DESIGNATED AS HIV TREATMENT HUBS/PRIMARY CARE AND CERTIFIED RHVDA CONFIRMATORY LABORATORIES

Region	Name of Facility	Address	Landline	Mobile
1	Ilocos Training and Regional Medical Center	Parian, San Fernando City, La Union	(072) 6076418 (072) 6079912	-
