

Average number of people newly diagnosed with HIV per day, selected years

NEWLY DIAGNOSED HIV CASES

In September 2019, there were 1,038 newly confirmed HIV-positive individuals reported to the HIV/AIDS & ART Registry of the Philippines (HARP). Nineteen percent (196) had clinical manifestations of advanced HIV infection (WHO clinical stage 3 or 4) at the time of testing [Table 1].

Ninety-five percent (985) of the newly diagnosed were male. The median age was 28 years old (age range: 1-71 years old). Half of the cases (50%, 519) were 25-34 years old and 31% (322) were 15-24 years old at the time of diagnosis.

Table 1: Summary of HIV diagnoses and deaths

Demographic Data	Sep 2019	Jan-Sep 2019	Jan 2014-Sep 2019	Jan 1984-Sep 2019
Total reported cases	1,038	9,749	55,302	71,778
With advanced infection ^a	196	1,693	7,289	8,791

Reported deaths ^d	35	564	2,798	3,617

Anti-retroviral Treatment (ART)*

In September 2019, there were 746 patients who were initiated on ART [Figure 3]. The median CD4 of these patients upon enrollment was 154 cells/mm³.

A total of 41,468 people living with HIV (PLHIV) were presently on ART as of September 2019. Most (97%) were males. The age of reported cases ranged from 1 to 81 years (median: 31 years old). Ninety-five percent were on first line regimen, 4% were on second line, and 1% were on other line of regimen.

Fig. 3: Number of ART initiation per month, 2017-2019

The total figure reflected on this section are the number of HIV positive adult and pediatric patients currently enrolled and accessing Antiretroviral (ARV) medication in 126 treatment hubs and primary HIV care treatment facilities that had reported in the HARP. This report did not include patients who have previously taken ARV but have died, left the country, have been lost to follow-up and/or opted not to take ARV. Lost to follow-up is considered once a person have failed to visit a treatment facility more than 3 months after the expected date of ARV refill.

*Due to reporting delay, data from the previous months with updated ART outcome were used for CPH-Carcar, Margosatubig Regional Hospital (Jul 2019) and Marikina SHC (Jun 2019). Figures in this section are subject to change after further validation or inclusion of delayed reports

Fig. 1: Number of newly diagnosed cases per month, 2017-2019

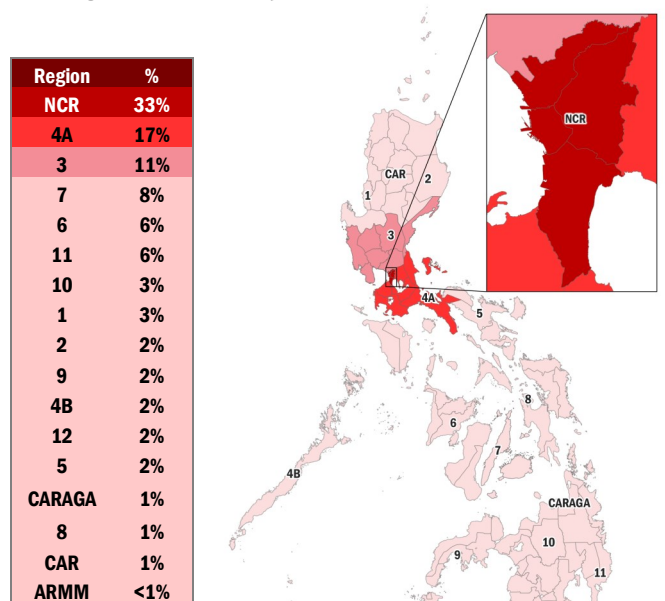

One third (33%, 342) were from the National Capital Region (NCR). Region 4A (17%, 172), Region 3 (11%, 113), Region 7 (8%, 85), and Region 6 (6%, 65) comprised the top five regions with the most number of newly diagnosed cases for the month, together accounting for 75% of the total [Figure 2].

Sexual contact remained as the predominant mode of transmission (97%, 1,011). Among the newly diagnosed, 59% (617) reported transmission through male to male sex, 25% (258) through sex with both males and females, and 13% (136) were through male to female sex. Other modes of transmission were sharing of infected needles (2%, 17) and mother-to-child transmission (<1%, 1). Nine cases had no data on mode of transmission.

Among the newly diagnosed females this month, 13 were pregnant at the time of testing. Six cases were from NCR, two cases each from Regions 4A, 7, 11 and one case from Region 3.

^a WHO clinical stage 3 or 4

^b No data on sex for 11 cases

^c No data on age for 73 cases

^d Reported deaths due to any cause and not necessarily AIDS-related

HIV/AIDS EPIDEMIC TRENDS IN THE PHILIPPINES (January 1984 - September 2019)

The first case of HIV infection in the Philippines was reported in 1984. Since then, there have been 71,778 confirmed HIV cases reported to the HARP. Ninety-four percent (67,317) of those diagnosed were male^e and 6% (4,450) were female^e. At the time of testing, more than half (51%, 36,523) were 25-34 years old^f while 20,566 (29%) were youth 15-24 years^f old. The median age was 28 years old (age range: 1 month - 82 years). Seventy-seven percent (55,302) of the total diagnosed cases in the Philippines were reported from January 2014 to September 2019. Twelve percent (8,791) of all reported cases had clinical manifestations of advanced infection^g at the time of reporting [Figure 4].

Fig. 4: Number of HIV cases and advanced infection reported in the Philippines by year, Jan 1984 to Sep 2019 (N=71,778)

Age and Sex

In the early years of the epidemic (1984-1990), 62% (133 of 216 cases) of those diagnosed were female. However, since 1991 the proportion of diagnosed males has been greater than that of females each year. From 1991 to present, males comprised 94% (67,234) of the 71,562^e diagnosed cases in the Philippines. In addition, from January 2018 to September 2019, three percent (622) of 20,064 diagnosed people who were assigned male at birth reported their self-identity as female (transgender women^h).

The number of diagnosed HIV infections among females has also been increasing [Figure 5]. From January to September 2019, 513 females were diagnosed with HIV, which was almost triple the number of female cases (185) of the same period in 2014. Ninety-two percent (4,111) of all female cases since 1984 were in the reproductive age group (15-49 years old) at the time of testing.

The predominant age group among those diagnosed has shifted to 25-34 years old starting 2006 from 35-49 years old in 2001 to 2005 [Figure 6]. Further, the proportion of HIV positive cases in the 15-24 year age group nearly doubled in the past ten years, from 17% in 2000 to 2009 to 29% in 2010 to 2019.

Fig. 5: Number of diagnosed females per year, Jan 1984 to Sep 2019 (N=4,450)

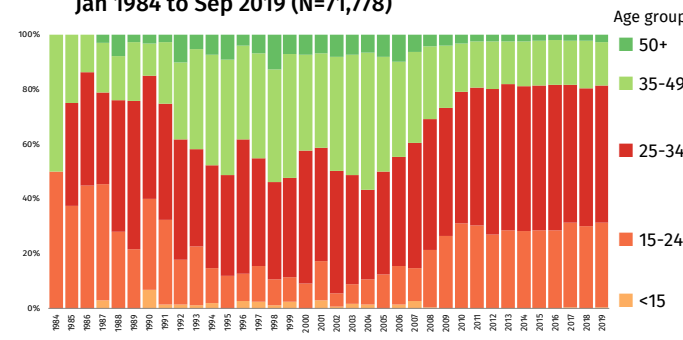

Fig. 6: Proportion of HIV cases by age group, Jan 1984 to Sep 2019 (N=71,778)

Geographic distribution

From January 1984 to September 2019, the regions with the most number of reported cases were NCR with 27,591 (38%) cases, Region 4A with 10,821 (15%) cases, Region 3 with 6,773 (9%) cases, Region 7 with 6,331 (9%) cases, and Region 11 with 4,029 (6%) cases. Twenty-one percent (15,095) of the cases came from the rest of the country while 1,138 (2%) did not report region of residence [Table 2].

Of the 4,450 females reported with HIV, 1,168 (26%) were from NCR, 678 (15%) were from Region 3, 550 (12%) were from Region 7, 515 (12%) were from Region 4A and 1,236 (28%) were from other regions; while 303 (7%) had no reported data on region of residence.

The regions with the most number of Overseas Filipino Workers (OFW) reported to HARP were from NCR with 2,235 (32%) cases, Region 4A with 1,205 (17%) cases, and Region 3 with 841 (12%) cases.

Table 2: Number of HIV cases diagnosed by region of residence

Region	Sep 2019 (N=1,038)	Jan-Sep 2019 (N=9,749)	Jan 2014 - Sep 2019 (N=55,302) ⁱ	Jan 1984 - Sep 2019 (N=71,778) ^j
NCR	342 (33%)	3,173 (33%)	19,991 (36%)	27,591 (38%)
4A	172 (17%)	1,602 (16%)	8,828 (16%)	10,821 (15%)
3	113 (11%)	1,070 (11%)	5,504 (10%)	6,773 (9%)

Rest of the country	263 (25%)	2,624 (27%)	12,942 (23%)	15,095 (21%)

^e Included herewith were 11 cases with no data on sex
^f No data on age for 73 cases
^g WHO clinical stage 3 or 4

^h Data on transgender identity was captured in HARP starting January 2018.
ⁱ No data on region of residence for 8 (<1%) cases
^j No data on region of residence for 1,138 (2%) cases

Modes of transmission (MOT)

From January 1984 to September 2019, sexual contact among males who have sex with males [MSM] (85%, 57,319) was the predominant MOT among males, followed by male-female sex (11%, 7,245), and sharing of infected needles (3%, 2,128). More than half of MSM (52%, 30,083) were 25-34 years old at the time of testing, and 31% (17,725) were 15-24 years old. Among diagnosed females, male-female sex was the most common MOT (93%, 4,121) followed by sharing of infected needles (3%, 133) [Table 3].

A total of 184 children (less than 10 years oldⁿ), eight adolescents (10-19 years oldⁿ), and one adult foreigner (22 years oldⁿ) were reported to have acquired HIV through mother-to-child transmission.

From 1984 to 2006, the predominant MOT was male-female sex. From 2007, the trend shifted to sexual contact among MSM as the predominant MOT and has remained as such to the present. From January 2014 to September 2019, 83% (46,080) out of the total (55,302) diagnosed cases were among MSM.

From 1984 to 2009, transmission through sharing of infected needles was less than one percent of the total cases reported. The proportion of HIV cases among people who inject drugs (PWID) increased sharply in 2010, at 9% (147) of the total cases reported that year. Further, the proportion of new cases among PWID remained at less than 6% of the total cases in the succeeding years (2011-2019).

Table 3: Modes of HIV transmission

Mode of Transmission	Sep 2019 (N=1,038)		Jan-Sep 2019 (N=9,749)		Jan 2014 - Sep 2019 (N=55,302)		Jan 1984 - Sep 2019 (N=71,778) ¹	
	M ^h	F ^h	M	F	M	F	M	F
Sexual contact	961	50	9,045	487	50,928	2,451	64,564	4,121
Male-female sex	86	50	804	487	4,848	2,451	7,245	4,121
Male-male sex	617	-	5,865	-	30,428	-	37,284	-
Sex w/ males & females ^m	258	-	2,376	-	15,652	-	20,035	-
Blood/blood products	0	0	0	0	0	0	5	15
Sharing of infected needles	14	3	91	7	1,474	77	2,128	133
Needlestick injury	0	0	0	0	0	0	2	1
Mother-to-child	1	0	14	13	71	60	103	90
No data	9	0	86	6	228	13	515	90

Regional patterns vary across different MOT. Forty-one percent of ever diagnosed males who have sex with males were from NCR; almost all (99%) reported cases among people who inject drugs were from Region 7; and 31% of females who engaged in transactional sex were from Region 3.

Fig. 7: Cumulative number of diagnosed per year by MOT, Jan 1984 to Sep 2019 (N=71,778)

SPECIFIC POPULATIONS

Youth (15-24 years old)

In September 2019, 322 (31%) cases were among youth 15-24 years old and 93% were male. Almost all were infected through sexual contact (36 male-female sex, 198 male-male sex, 83 sex with both males & females^m). One case was infected through sharing of needles and four had no data on the MOT.

From January 1984 to September 2019, 20,566 (29%) of the reported cases were 15-24 years old. Ninety-seven percent (19,952) were infected through sexual contact (2,227 male-female sex, 11,962 male-male sex, 5,763 sex with both males & females^m), 477 (2%) were infected through sharing of needles, one (<1%) was infected through mother-to-child transmission, and 136 (1%) had no data on the MOT. Eighty percent (16,382 out of 20,566) of all those 15-24 years old at the time of testing were diagnosed from January 2014 to September 2019. Since 2004, more males were diagnosed from this age group. However, the number of diagnosed HIV cases among female youth had increased significantly in the past five years. The total diagnosed females aged 15-24 years old (154) in January to September 2019 nearly quadrupled as compared with the same reporting period (44) in 2014.

^h Sex at birth; M= Male, F = Female
¹ No data on MOT and sex for 11 cases
^m Among males only
ⁿ Age was based at the time of testing

^a Cumulative HIV cases include reported deaths and 616 cases with no data on MOT, Jan 1984-Sep 2019
^p Others include the following MOT: needle prick injury, blood/blood products, and mother-to-child transmission

Children (<10) & Adolescents (10-19)

In September 2019, there were 50 newly diagnosed adolescents at the time of testing. Of these, 10 were 15-17 years old and 40 were 18-19 years old. Ninety-six percent were infected through sexual contact (8 male-female sex, 31 male-male sex, and 9 had sex with both males & females⁹), one was infected through sharing of needles and one had no data on the MOT. Further, one child was diagnosed with HIV and was infected through mother-to-child transmission.

Four percent (3,070) of all diagnosed cases from January 1984 to September 2019 were 19 years old and younger at the time of testing. Of these, six percent (187) were children less than 10 years old. Among children, 184 were infected through mother-to-child transmission; one through blood transfusion; and two had no data on MOT. Further, 94% (2,883) were adolescents. Twenty-two were 10-14 years old, 400 were 15-17 years old and 2,461 were 18-19 years old. Of the adolescents, 96% were infected through sexual contact (326 male-female sex, 1,785 male-male sex, and 650 sex with both males & females⁹). While 90 (3%) were infected through sharing of infected needles, 8 (<1%) through mother-to-child transmission, and 24 (1%) had no data on the MOT.

Fig. 8: MOT among children and adolescents, Jan 1984 to Sep 2019 (N=3,070)

Overseas Filipino Workers (OFW)

Sixty-seven Filipinos who worked overseas within the past five years, whether on land or at sea, were diagnosed in September 2019. They comprised 6% of the total newly diagnosed cases for the month. Of these, 90% (60) were male. All were infected through sexual contact (21 male-female sex, 33 male-male sex, and 13 sex with both males and females⁹). The ages of male OFWs ranged from 20 to 57 years (median: 33 years). Five were 15-24 years old, 33 were 25-34 years old, 20 were 35-49 years old, and two cases were 50 years & older. Among the seven female OFWs diagnosed in September 2019, five were 25-34 years old and two were 50 years and older at the time of testing. The age range among diagnosed female OFWs were 26 to 53 years (median: 30 years old).

From January 1984 to September 2019, ten percent (6,972) of the total cases were OFWs [Figure 9]. Of these, 6,032 (87%) were male and 99% were infected through sexual contact (1,561 male-female sex, 2,587 male-male sex and 1,811 sex with both males and females⁹). The ages of male OFWs ranged from 16 to 80 years (median: 32 years).

Further, among the 940 female OFWs, 97% were infected through sexual contact. The ages of female OFWs ranged from 20 to 73 years (median: 34 years old).

Fig. 9: Number of reported OFW diagnosed with HIV, Jan 1984 to Sep 2019 (N=6,972)

People who engage in transactional sex

People who engage in transactional sex are those who reported that they either pay for sex, regularly accept payment for sex, or do both. Reporting of transactional sex was included in the HARP starting December 2012.

In September 2019, 16% (163) of the newly diagnosed engaged in transactional sex [Table 4]. Ninety-five percent (155) were male and aged from 18 to 71 years old (median: 29 years). Fifty-six percent (87) of the males reported paying for sex only, 32% (49) reported accepting payment for sex only and 12% (19) engaged in both. Also, among the eight female cases who engaged in transactional sex, seven were reported to have accepted payment for sex only and one case had engaged in both paying and accepting payment in exchange for sex.

A total of 7,323 cases reported to HARP from December 2012 to September 2019 were people who engaged in transactional sex. Ninety-six percent (7,035) were male. There were 3,914 (53%) who paid for sex, 2,324 (32%) who accepted payment for sex, and 1,085 (15%) who engaged in both [Table 4].

Table 4: Age and sex of people diagnosed with HIV who engaged in transactional sex

Type of Transactional Sex	Sep 2019 (N=163)	Jan-Sep 2019 (N=1,256)	Dec 2012-Sep 2019 (N=7,323)
Accepted payment for sex only:	56 (34%)	420 (33%)	2,324 (32%)
Male	49	390	2,147
Female	7	30	177
Age Range (Median)	18-39 (27)	15-55 (26)	12-68 (26)
Paid for sex only:	87 (54%)	669 (53%)	3,914 (53%)
Male	87	666	3,890
Female	0	3	24
Age Range (Median)	19-71 (31)	13-77 (31)	13-79 (31)
Engaged in both:	20 (12%)	167 (14%)	1,085 (15%)
Male	19	160	998
Female	1	7	87
Age Range (Median)	18-56 (31)	17-56 (30)	15-62 (29)

⁹ Among males only

Pregnant women living with HIV

Reporting of pregnancy status at the time of testing was included in the HARP starting year 2011.

In September 2019, 13 pregnant women were newly diagnosed with HIV. Six cases were from NCR, two cases each from Regions 4A, 7, 11 and one case from Region 3. The age of diagnosis ranged from 17 to 36 (median age: 25).

Since 2011, a total of 355 diagnosed pregnant women were reported. More than half (53%, 189) were 15-24 years old at the time of diagnosis, and 38% (136) were 25-34 years old [Figure 10]. The regions with highest number of diagnosed pregnant cases with HIV were NCR (48%), Region 7 (22%), Region 4A (10%), and Region 3 (6%).

Fig. 10: Number of HIV positive women who were pregnant at the time of testing by age group, Jan 2011 to Sep 2019 (N=355)

DEATHS AMONG PEOPLE WITH HIV**

In September 2019, there were 35^r reported deaths due to any cause among people with HIV. Ninety-four percent (33) were males [Table 5]. Ten (29%) cases were 15-24 years old at the time of death, 20 (57%) were 25-34 years old, four (11%) were 35-49 years old and one (3%) was 50 years and older. All of the cases were reported to have acquired the infection through sexual contact: 7 through male-female sex, 22 through male-male sex, and 6 through sex with both males and females^s.

A total of 3,617 deaths were reported from January 1984 to September 2019, and 91% (3,300) of whom were male. Twenty-six (1%) were less than 15 years old at the time of death, 544 (15%) were 15-24 years old, 1,803 (50%) were 25-34 years old, 1,017 (28%) were 35-49 years old, and 225 (6%) were 50 years and older [Table 5]^r.

Sexual contact (96%) was the most common mode of HIV transmission among reported deaths (758 through male-female sex, 1,719 through male-male sex, 993 through sex with both males and females^s). Other modes of transmission of reported deaths were sharing of infected needles (79), mother-to-child transmission (26), and blood transfusion (9) [Figure 11]^u.

Table 5: Demographic data of reported deaths among people with HIV

Demographic Data	Sep 2019	Jan-Sep 2019	Jan 1984 – Sep 2019

HIV/AIDS & ART Registry of the Philippines (HARP)

The HIV/AIDS & ART Registry of the Philippines (HARP) is the official record of total number of diagnoses (laboratory-confirmed) and deaths among people with HIV in the Philippines. All individuals in the registry are confirmed by the San Lazaro Hospital STD/AIDS Cooperative Central Laboratory (SACCL) which is the National Reference Laboratory (NRL) of the Department of Health (DOH) for HIV/AIDS. Mandatory HIV testing is unlawful in the Philippines (Republic Act 11166).

The process of reporting to the HARP is as follows: All blood samples from accredited HIV testing facilities that were screened HIV reactive are sent to SACCL for confirmation by Western Blot. Confirmed HIV positive individuals were reported to the DOH-Epidemiology Bureau (EB) and recorded to HARP.

HARP is a passive surveillance system. Except for HIV confirmation by the NRL, all other data submitted to the HARP are secondary and cannot be verified. Hence, HARP cannot determine if an individual's reported place of residence is where the person got infected, or where the person lived after being infected, or where the person is presently living. This limitation has major implications on data interpretation. Readers are advised to interpret the data with caution and consider other sources of information before arriving at conclusions.
