Figure 1. Number of New HIV Cases by Month (2015-2017)*

*Due to the system enhancement done in 2016, the number of cases for September 2015, March 2016, June 2016, and July 2016 were changed upon updating the database.

In December 2017, there were 992 new HIV antibody sero-positive individuals reported to the HIV/AIDS & ART Registry of the Philippines (HARP) [Table 1]. Eighty-six percent of those were asymptomatic at the time of reporting.

Most (97%) were male. The median age was 27 years old (age range: 4 to 70 years). Half (50%) of the cases were from the 25-34 year age group while 33% were youth aged 15-24 years.

The regions with the most number of reported cases were: National Capital Region (NCR) with 351 (35%) cases, Region 4A with 147 (15%) cases, Region 3 with 106 (11%) cases, Region 7 with 74 (7%) cases, Region 6 with 66 (7%) cases and Region 11 with 41 cases (4%). Additional 207 cases (21%) came from the rest of the country.

Reported modes of transmission were sexual contact (962), needle sharing among injecting drug users (IDU) [24] and mother-to-child transmission (2). Eighty-seven percent of infections transmitted through sexual contact were among males who have sex with males (MSM^a). There were four cases that had no data on mode of transmission.

A total of eight pregnant women were diagnosed with HIV in December 2017; four cases from NCR and one case each from Regions 3, 4A, 6, and 7. Age ranges from 15 to 48 years old (median: 24).

Figure 2. Percentage of Newly Diagnosed Cases per Region (December 2017)

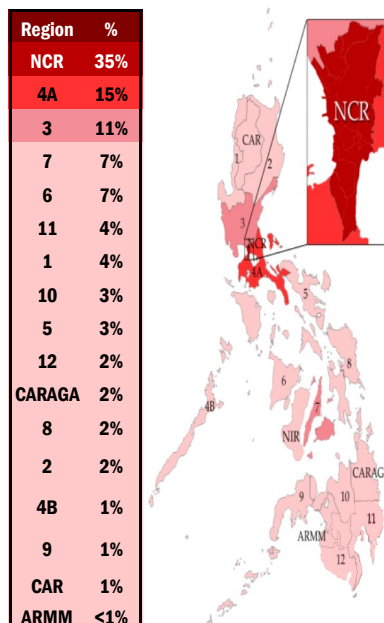

Figure 3. Number of HIV Cases Reported in the Philippines by Year, January 1984 to December 2017 (N=50,725)*

*Due to the system enhancement done in 2016, the number of cases for September 2015, March 2016, June 2016, and July 2016 were changed upon updating the database.

PLHIV on Anti-Retroviral Therapy (ART)

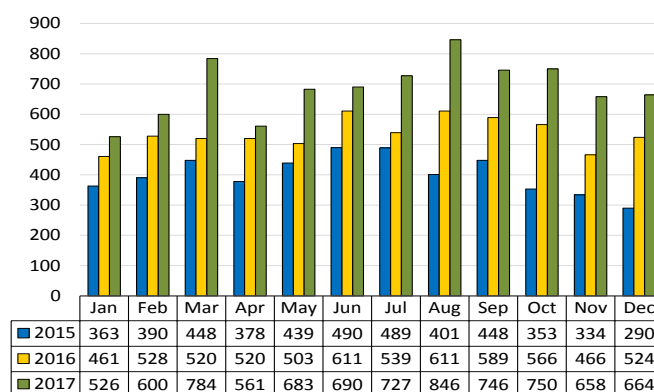

In December 2017, there were 664 patients who started on ART. The median CD4 of these patients upon enrollment was 216 cells/mm³.

A total of 24,754* PLHIV were presently on ART as of December 2017. Most (97%) were males. The median age of patients was 31 years (range: 7 months-77 years). Ninety-five percent were on first line regimen, 4% were on second line regimen, and 1% were on other line.

**This is the total number of adult and pediatric patients currently enrolled and accessing antiretroviral drugs (ARV) in the 51 treatment hubs and satellites. It does not include patients who were previously taking ARV but have died, left the country, have been lost to follow up, or opted not to take ARV anymore. A person is considered lost to follow up if the person has not visited a treatment facility more than 3 months after the expected date of ARV pick up.*

Note: October data used for ITRMC due to reporting delay and no data submitted from Maria Aurora Community Hospital & Negros Oriental Provincial Hospital

Figure 4. Number of Newly-Initiated on ART by Month (2015-2017)

HIV/AIDS EPIDEMIC TRENDS IN THE PHILIPPINES (January 1984 - December 2017)

The first AIDS case in the Philippines was reported in 1984. From January 1984 to December 2017, there has been 50,725 HIV Ab sero-positive cases reported to the HARP (Table 1). Ninety percent (45,645) of the total reported cases were asymptomatic at the time of reporting. Ninety-three percent (47,387) were male and 3,327 (7%) were female*. The median age* was 28 years old (age range: 1 year - 82 years). More than half (25,967 or 51%) were from the 25-34 year age group while 14,171 (28%) were youth aged 15-24 years (Figure 5).

Eighty-four percent (42,361) of all the 50,725 diagnosed cases in the Philippines were reported from January 2012 to December 2017 (Table 1). Most (90%) of these cases were still asymptomatic at the time of reporting.

In the early years of the epidemic (1984-1990), 62% (133 of 216 cases) were female. From 1991 to present, males comprise

94% (47,304 out of 50,509) of the total number of HIV/AIDS cases in the Philippines in the aforementioned time period.

However, the absolute number of cases among females has also been increasing [Figure 6]. Moreover, cases of HIV transmission from mother-to-child are more likely to increase if female patients are not linked to HIV care. Ninety-three percent (3,078) of all female cases were diagnosed during their reproductive age (15-49 years old).

Also, in terms of age, the proportion of cases became younger: between 2001 to 2005, it was 35-49 years; starting from 2006, the age proportion shifted to 25-34 years (Figure 5). The proportion of HIV positive cases in the 15-24 year age group increased from 25% in 2006-2010 to 29% in 2011-2017.

**Note: From 1984 — December 2017, 74 did not report AGE, 11 did not report SEX*

Figure 5. Distribution of HIV Cases by Age Group, January 1984 - December 2017

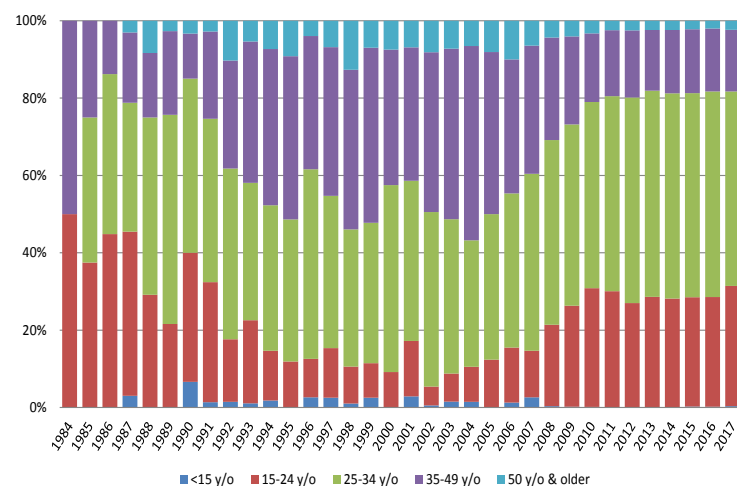

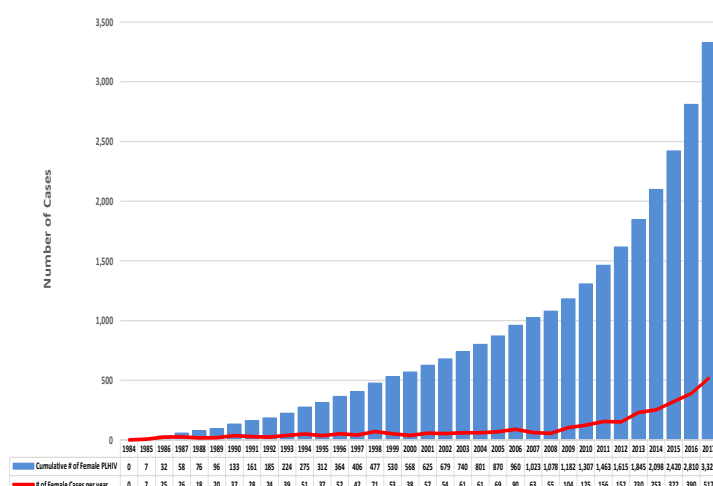

Figure 6. Number of HIV Cases among Females per Year, Jan 1984 - Dec 2017 (N=3,327)

Geographical Distribution

From January 1984 to December 2017, the regions with the most number of reported cases were NCR with 20,880 (41%) cases, Region 4A with 7,362 (15%) cases, Region 7 with 4,620 (9%) cases, Region 3 with 4,481 (9%) cases, and Region 11 with 2,939 (6%) cases. Eighteen percent (9,297) of the cases came from the rest of the country (ROTC) while 1,146 (2%) did not report region of residence (Table 2).

Of the 3,327 females reported with HIV, 863 (26%) were from NCR, 540 (16%) were from Region 3, 396 (12%) were from Region 7, 346 (10%) were from Region 4A and 878 (26%) were from other regions while 304 (9%) did not report region of residence.

The regions with the most number of Overseas Filipino Workers (OFW) reported to HARP were NCR with 1,885 (35%) cases, Region 4A with 920 (17%) cases, and Region 3 with 605 (11%) cases.

Mother-to-Child	2	0	21	15	50	38	79	64
No Data Available	4	0	61	6	61	6	348	83

^aFrom January 1984–December 2017, 11 did not report sex

From 1984 to 2009, transmission through sharing of infected needles were at <1% of the total cases reported. The cases among injecting drug users (IDU) spiked in 2010 comprising 9% (147) of the total cases reported that year. However, new cases among people who inject drugs decreased to <6% of the total cases in succeeding years.

In different regions, predominant modes of transmission vary distinctively. Almost half (45%) of cases with sexual contact among MSM ever reported were from NCR; almost all (99%) of the IDU were from Region 7; and 36% of females who engaged in transactional sex were from Region 3.

Figure 7. Cumulative Number of HIV Transmission by Year, January 1984 - December 2017 (N=50,725)^a

^aNo reported Mode of Transmission for (442) cases

^bOthers include the following MOT: needle prick injury, blood/blood products, and mother-to-child transmission

Note: Due to the system enhancement done in 2016 & 2017, the number of cases for September 2015, March 2016, June 2016, July 2016 and June 2017 were changed upon updating the database.

REPORT ON SPECIAL POPULATIONS

Youth (15-24 years old)

In December 2017, 332 (33%) cases were among youth aged 15-24 years and 97% were male. Almost (331) were infected through sexual contact (29 male-female sex, 223 male-male sex, 79 sex with both males & females) and one case had no data on mode of transmission.

From January 1984 to December 2017, 14,171 (28%) of the reported cases were 15-24 years old. Ninety-six percent (13,634) were infected through sexual contact (1,615 male-female sex, 7,854 male-male sex, 4,165 sex with both males & females); 457 were infected through needle sharing among IDU, and one was infected through mother-to-child transmission. Furthermore, from January 2012 to December 2017, 12,254 (86%) were reported among the total (14,171) youth population. From 1984 to 2002, seventy one percent (179) of the cases among the youth were females. However, in 2003, there was an equal number of males and females reported. Since then, the trend shifted to male predominance.

Note: From January 1984–December 2017, 79 did not report mode of transmission among 15 to 24 years old

REPORT ON SPECIAL POPULATIONS (continuation)**Children (<10 years old) and Adolescents (10-19 years old)**

In December 2017, a total of 66 adolescents aged 10-19 years were reported to HARP. All were infected through sexual contact (6 male-female sex, 48 male-male sex, 12 had sex with both males & females). Further, there were two children aged below 10 years reported to be HIV positive and both cases were infected through mother-to-child transmission.

From January 1984 to December 2017, 2,033 (4%) of the reported cases were 19 years old and below. Seven percent (137 out of 2,033) were children and among them 134 were infected through mother-to-child transmission, one through blood transfusion and two had no specified mode of transmission. Ninety-three percent (1,896 out of 2,033) were adolescents. Among these, 1,730 (91%) were male. Most (94%) of the adolescents were infected through sexual contact (224 male-female sex, 1,114 male-male sex, 453 sex with both males & females), 86 (5%) were infected through sharing of infected needles, 8 (<1%) through mother-to-child transmission, and 11 had no specified data on the mode of transmission (Figure 8).

Figure 8. Modes of Transmission Among Children and Adolescents, January 1984 - December 2017 (N=2,033*)

*Note: No mode of transmission reported for 13 cases

Overseas Filipino Workers (OFW)

Fifty-nine OFWs were reported in December 2017, comprising 6% of the total newly diagnosed cases. Ninety-three percent (55) were male. All were infected through sexual contact (18 male-female sex, 27 male-male sex, and 14 sex with both males and females) [Figure 10]. The ages of male OFWs ranged from 18-67 years (median: 29 years). Sixty-five percent of the cases belonged to the 25-34 year age group. Among the female OFWs diagnosed in December 2017, half belonged from 25-34 age group while the other half belonged from 35-49 age group. The age ranges from 31-48 years (median: 38 years).

From January 1984 to December 2017, out of the 50,725 cases, 5,453 (11%) were HIV-positive OFWs (Figure 9). Of these, 4,678 (86%) were male. Majority of the male cases (70%) were infected through sexual contact among MSM (1,838 male-male sex and 1,420 sex with both males & females). The ages of male OFWs ranged from 16 to 80 years (median: 32 years). Among female OFWs, ages ranged from 20 to 73 years (median: 34 years old).

Figure 9. Number of Reported OFW diagnosed with HIV, Jan 1984 - Dec 2017 (N=5,453)

Figure 10. Modes of Transmission among OFW, Jan 1984 - Dec 2017 (N=5,453)

**People who Engage in Transactional Sex**

(Inclusion of transactional sex in the HARP database was initiated in December 2012)

People who engaged in transactional sex are those who report that they pay for sex, regularly accept payment for sex, or do both.

In December 2017, 11% (105) of the reported cases engaged in transactional sex. Most (96%) were male (Table 4) whose ages ranged from 17 to 68 years (median: 29 years). Among female cases the age ranges from 19 to 32 (median: 30 years).

A total of 4,647 cases reported to HARP from December 2012 to December 2017 were people who engaged in transactional sex. Ninety six percent (4,457) were male and 4% (190) were female. There were 2,489 (54%) who paid for sex, 1,429 (30%) accepted payment for sex, and 729 (16%) engaged in both.

Table 4. HIV Cases Among People who Engage in Transactional Sex

Type of Transactional Sex	Dec 2017 (N=105)	Jan-Dec 2017 (N=1,125)	Cumulative Dec 2012-Dec 2017 (N=4,647)
Accepted payment for sex only:	39 (37%)	367(33%)	1,429 (30%)
Male	37	348	1,326
Female	2	19	103
Age Range (Median) in Years	17-68 (26)	16-68 (27)	15-68 (26)
Paid for sex only:	55 (52%)	585 (52%)	2,489 (54%)
Male	55	582	2,473
Female	0	3	16
Age Range (Median) in Years	19-57 (31)	17-64 (31)	16-79 (31)
Engaged in both:	11 (11%)	173 (15%)	729 (16%)
Male	9	155	658
Female	2	18	71
Age Range (Median) in Years	17-62 (29)	16-62 (28)	16-62 (28)

REPORT ON SPECIAL POPULATIONS (continuation)**Pregnant Women Living with HIV (PWLHIV)**

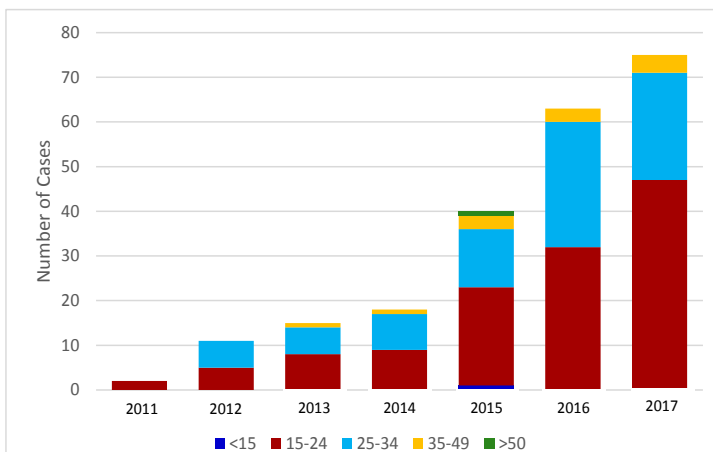

(Inclusion of pregnant women living with HIV in the HARP database was initiated in 2011)

Beginning 2011, pregnant women living with HIV have been included in the HIV/AIDS Registry. The number of reported cases continues to increase yearly (Figure 11).

In December 2017, a total of eight pregnant women were diagnosed with HIV; four cases from NCR and one case each from Regions 3, 4A, 6, and 7. Age ranges from 15 to 48 years old (median: 24).

Since 2011, a total of 224 pregnant cases were reported. More than half (125 or 56%) were from the age group 15-24 years old and 38% (85) were from the age group of 25-34 years old. The regions with highest number of cases are NCR (50%), Region 7 (24%), and Region 4A (9%).

Figure 11. Number of Diagnosed Pregnant Cases Jan 2011 - Dec 2017 (N=224)

**DEATHS AMONG PEOPLE WITH HIV**

In December 2017, there were 69 reported deaths. Most (96%) were male (Table 5). More than half of the cases (40 or 58%) cases were from 25-34 year age group, seven (10%) cases were from the youth aged 15-24 yo, 20 (29%) cases belonged from 35-49 year age group and two (3%) cases were 50 years old and above. Almost (99%) of the cases were infected through sexual contact (14 male-female sex, 36 male-male sex, 18 sex with both males & females) & there was one (1%) reported death who was infected through sharing of needles. [Figure 12]

A total of 2,466 deaths were reported from January 1984 to December 2017. Eighty-nine percent (2,203) were male. Of the reported deaths, almost half (1,206 or 49%) of the cases belonged from 25-34 year age group, 19 (1%) cases were aged less than 15 years old, 362 (15%) cases were from the youth aged 15-24 y.o., 700 (28%) belong to 35-49 year age group, and 176 (7%) cases were aged 50 years and above [Table 5]^a. Sexual contact (96%) was the common mode of HIV transmission (568 male-female sex, 1,145 male-male sex, 659 sex with both males and females). There were 45 reported deaths among those who were infected through sharing of needles, 18 deaths among those who were infected through mother-to-child transmission, and 9 among those who were infected through blood transfusion [Figure 12]^b.

^aNo data available on age for (3) cases

^bNo data available on mode of transmission for (22) cases

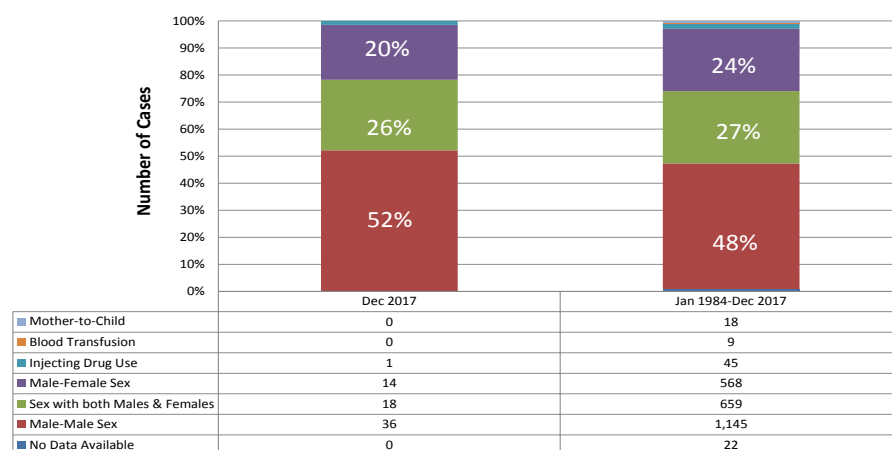

Table 5. Demographic data of reported deaths among People with HIV

Demographic Data	December 2017	Jan-Dec 2017	Cumulative Jan 1984-Dec 2017
Total Reported Deaths	69*	497	2,466**
Male	66	471	2,203

HIV/AIDS & ART Registry of the Philippines (HARP)

The Philippine HIV/AIDS & ART Registry of the Philippines (HARP) is the official record of the total number of laboratory-confirmed HIV positive individuals, AIDS cases and deaths, and HIV positive blood units in the Philippines. All individuals in the registry are confirmed by the STD/AIDS Cooperative Central Laboratory (SACCL) at San Lazaro Hospital. The National Reference Laboratories (NRL) of the Department of Health (DOH) for HIV/AIDS.

Mandatory HIV testing is unlawful in the Philippines (RA 8504). The process of reporting to the HARP is as follows: All blood samples from accredited HIV testing facilities that are screened HIV reactive are sent to SACCL (individuals). Confirmed HIV positive individuals are reported to the DOH-Epidemiology Bureau (EB), and are recorded in the HARP.

The HARP is a passive surveillance system. Except for HIV confirmation by the NRL, all other data submitted to the HARP are secondary and cannot be verified. An example would be an individual's reported place of residence. The HARP is unable to determine if this reported address is where the person got infected, or where the person lived after being infected, or where the person is presently living, or whether the address is valid. This limitation has major implications to data interpretation. Thus, readers are cautioned to carefully weigh the data and consider other sources of information prior to arriving at conclusions.
