Different Types of Temperature Monitoring Devices

TEMPERATURE MONITORING DEVICES: AN OVERVIEW

LOCATION	MINIMUM WHO RECOMMENDATION	AVAILABLE WHO PREQUALIFIED DEVICES (July 2013)		DEVICE USE
INTERNATIONAL VACCINE SHIPMENTS (2°C to 8°C)	Electronic shipping indicators (liquid-crystal display [LCD] or computer downloadable)	**20-DAY ELECTRONIC SHIPPING INDICATORS** (irreversible)		Monitors temperature during shipment of vaccines. Alarm is activated if temperatures exceed or fall below the recommended range. Single use; once the alarm has been activated, the device cannot be used again.
INTERNATIONAL VACCINE SHIPMENTS (-20°C [e.g., oral polio vaccine])	Cold chain monitor cards	**COLD CHAIN MONITOR CARDS** (irreversible)		Monitors temperature during shipment of frozen vaccine. Single use; once the alarm has been activated, the device cannot be used again.
THROUGHOUT THE SUPPLY CHAIN	Vaccine vial monitors (VVM)	**VVM2, VVM7, VVM14, VVM30** (irreversible) Types are determined by WHO based on heat stability of vaccine.	 Photo: Umit Kartoglu	Assesses heat exposure of individual vials or other primary containers of vaccines. Used throughout the supply chain.
COLD ROOMS AND FREEZER ROOMS	Continuous temperature monitoring systems with alarm and a back-up dial thermometer	**INTEGRATED DIGITAL OR DIAL TEMPERATURE MONITORS**	 Photo: PATH/Amy MacIver Included on all PQS prequalified cold rooms and freezer rooms.	Monitors the temperature inside a cold room or freezer room. Presents an external visual display of the current temperature.
		DIAL THERMOMETERS (gas/vapor pressure)	 Photo: World Health Organization	Monitors current temperature. Included with all cold/freezer room purchases. May be used as a backup external temperature display in case of power failure.
		CENTRAL TEMPERATURE MONITORING SYSTEMS	 Photo: PATH and Berlinger & Co. Photo: PATH	Monitors temperatures and sends recorded data and alarms to a central server or cellular phone at set intervals. Recommended for large, multiple, or remote cold/freezer rooms.
		30-DAY ELECTRONIC TEMPERATURE RECORDERS		Records temperatures at regular intervals. Provides alarms if temperatures exceed or fall out of range. If a central temperature monitoring system is not relevant, available, and/or affordable, device may be used as a back-up external temperature display or internal recording device in case of power failure.
		FREEZE INDICATORS (irreversible)		May be used as a backup indicator for potential freeze exposure in low-temperature locations within a cold room. Single use; once the alarm has been activated, the device cannot be used again. Not used in freezers.
REFRIGERATED VEHICLES	Electronic continuous temperature monitoring systems with recording capacity and one freeze indicator per shipment	**DASHBOARD-MOUNTED CONTINUOUS TEMPERATURE MONITORS**	No prequalified products are currently available.	Monitors current temperature inside refrigerated vehicle. Installed in refrigerated vehicle with visual dashboard mount.
		FREEZE INDICATORS (irreversible)		Detects freeze incidents. One freeze indicator should be placed near the most freeze-sensitive vaccine in the shipment when the vaccine is packed in the issuing store. Single use; once the alarm has been activated, the device cannot be used again.

Unless otherwise indicated, all photos: PATH/Patrick McKern.

August 2013

TEMPERATURE MONITORING DEVICES: AN OVERVIEW

LOCATION	MINIMUM WHO RECOMMENDATION	AVAILABLE WHO PREQUALIFIED DEVICES (July 2013)		DEVICE USE
REFRIGERATORS	Integrated digital or dial thermometers	INTEGRATED DIGITAL OR DIAL THERMOMETERS	 Photo: PATH/Amy MacIver Included on all PQS prequalified refrigerators	Monitors current temperature and displays temperature externally.
		FREEZE INDICATORS (irreversible)	 Freeze-tag®  FreezeAlert®  Q-tag® Quad	Detects freezing incidents. Not needed if 30-day temperature recorders are used. Single use; once the alarm has been activated, the device cannot be used again.
		30-DAY ELECTRONIC TEMPERATURE RECORDERS	 LogTag® TRID30-7FW  Fridge-tag®  Fridge-tag 2®	Records temperatures at regular intervals. Provides alarms if temperatures exceed or fall out of range. Used to ensure that equipment is functioning effectively.
FREEZERS	Integrated digital or dial thermometers	INTEGRATED DIGITAL OR DIAL THERMOMETERS	 Photo: PATH / Amy MacIver Included on all PQS prequalified freezers	Monitors current temperature and displays temperature externally.
		DIAL THERMOMETERS (gas or vapor pressure)	 Rueger TFV1008I Photo: World Health Organization	Monitors current temperature. External display of freezer temperature.
COLD BOXES AND VACCINE CARRIERS	Irreversible freeze indicators when freeze sensitive vaccine is being transported	FREEZE INDICATORS (irreversible)	 Freeze-tag®  FreezeAlert®  Q-tag® Quad	Detects freezing incidents. Single use; once the alarm has been activated, the device cannot be used again.
		20-DAY ELECTRONIC SHIPPING INDICATORS	 VaxAlert®  LogTag® TIC20  Q-tag® CLm doc  Q-tag2 plus®  Q-tag® CLm	Monitors temperatures inside cold boxes and vaccine carriers during transport. Provides alarms if temperatures exceed or fall below range. Typically used in shipping but could be used in cold boxes and vaccine carriers. Single use; dispose of after 20 days.
		VVM + PEAK TEMPERATURE INDICATORS	No prequalified peak temperature indicators available.	Used together, the VVM and peak temperature indicator show whether cumulative or peak heat exposure has occurred. Used for transport of vaccines licensed for use in a temperature controlled chain.
TEMPERATURE MAPPING OF COLD ROOMS AND FREEZER ROOMS	30-day temperature recorders or user programmable data loggers	30-DAY ELECTRONIC TEMPERATURE RECORDERS	 LogTag® TRID30-7FW  Fridge-tag®  Fridge-tag 2®	Records temperatures at regular intervals. Provides alarms if temperatures exceed or fall out of range. Used to map temperatures in cold/freezer rooms. Devices are placed in specific areas of the cold or freezer rooms or as part of a centralized system with wireless sensors.
STUDIES OF THE ENTIRE SUPPLY CHAIN OR A PORTION OF THE SUPPLY CHAIN (e.g., validating transport routes)	User programmable data loggers	USER PROGRAMMABLE DATA LOGGERS	 Libero CB PDF Logger®  Libero CS PDF Logger®  Libero Tri PDF Logger®  LogTag® PTE030-7F  LogTag® PTI030-7F  LogTag® TRIX-8	Records temperatures at user-specified intervals. Provides alarms if temperatures exceed or fall out of range. Used for studies to understand the quality of existing cold chain equipment and management and report the temperature profiles of vaccines throughout the supply chain.

Example of emergency scenarios requiring implementation of the contingency plan

1. Refrigerator breakdown

Scenario 1:

A health facility has a 1 top-opening electric compression refrigerator. The refrigerator recorded temperatures for the past succeeding days fluctuate between 12 °C and 15 °C.

Recommended actions:

- Confirm that the temperature reading is correct by verifying it with another thermometer of the same type which is proven to be accurate.
- Use the proven thermometer to monitor the temperature for at least one day.
- If the temperature is within the normal range of +2°C to +8°C, replace the faulty existing thermometer with an accurate one.
- If the temperature is still outside the temperature range of +2°C to +8°C, visually check the following:
  - Vaccines are arranged properly with good air circulation and not overloaded.
  - Frost build up on the evaporator surface, defrost if frost is more than 5 mm thick.
  - Door is closing tightly, tighten the door hinges if door is not closing properly.
  - Check if the unit is well ventilated, move refrigerator to a well ventilated location and away from sunlight rays or heat emitting source.
  - If no problem is found, transfer vaccines in the cold box or vaccine carrier with conditioned icepacks or request for other health facility to accommodate the vaccines.
  - Record the name of vaccines, quantity, expiry date and VVM status.
  - Inform supervisor or request assistance of cold chain technician for troubleshooting and repair.

2. Electricity power failure

Scenario 2:

A service facility has a PQS compliant ice-lined refrigerator MK 144. Power interruption has been observed for about 10 hours and significant quantities of vaccines are in the refrigerator.

Recommended actions:

- Verify the hold over time of MK 144 from the WHO PQS catalogue.
- If the power interruption is more than the hold over time of the equipment, prepare a cold box, vaccine carrier and conditioned icepacks to temporarily hold the vaccines until the electricity power is restored.
- Check the cold life of the cold box or vaccine carrier to determine how much longer you can keep the vaccines inside.
- If no icepacks are available identity some stores where you can borrow icepacks or use commercial ice in plastic bag and condition it prior to use.
- Keep the refrigerator closed. Avoid opening the unit unnecessarily to maximize the cold life that will keep vaccine potent.
- Record the event and inform supervisor accordingly.

3. Cold chain failure (loss of vaccine potency)

Scenario 3:

The health facility is equipped with a domestic type electric compression refrigerator. The recorded temperature ranges between +3°C in the morning and +8°C in the afternoon. The health facility is closed on Saturdays and Sundays and no health staff come to the facility to monitor and record the temperature. On a Saturday evening there was a power failure for more than 6 hours. On a Sunday early in the morning the electricity has been restored and the unit operates as usual but its thermostat malfunctioned and was not able to switch off the compressor motor. On Monday morning the temperature recorded by the health worker is +3°C; however, it was observed that the freeze tag indicator is already on alarm status.

Recommended actions:

- Check the inventory record and quantity of freeze sensitive and heat sensitive vaccines.
- Check the VVM of all the vaccines particularly the heat sensitive ones; If the VVMs are still in stage 1 or 2, continue to administer the heat sensitive but not freeze sensitive vaccines.
- Do not use the freeze sensitive vaccines until the shake test is conducted.
- Record the event and inform supervisor accordingly.
- If this event occurs frequently, request for a PQS compliant vaccine refrigerator with adequate hold over time.
- Someone should be assigned to check and monitor the vaccine refrigerator on weekends and holidays.

4. Measles vaccine outbreak

Scenario 4:

A measles outbreak has occurred in one province and an immediate response is required to vaccinate 1 to 5 year old children. The estimated target population for the measles outbreak is 280,000 children. The province has a vaccine storage facility with ice lined refrigerators, ice pack freezers, cold box and vaccine carriers.

Recommended actions:

- Calculate the quantity of vaccine and safe immunization supplies requirements to address the epidemic.
- Use the vaccine database (cm^3/dose) to calculate the vaccine storage capacity requirements in liters.
- Use the cold chain equipment inventory and refrigerator data base to determine the total existing storage capacity.
- Determine whether the available existing storage capacity of vaccine refrigerators can cope with the additional storage capacity of the emergency vaccines.
- Determine the quantity of routine EPI vaccines and immunization supplies that are available in stock.
- Determine the actual vaccine storage requirements.
- Determine the number of cold boxes, vaccine carriers and ice packs that are available.
- Determine how many vaccination teams are needed to cope up with the emergency and estimate the number of vaccine carriers and icepacks that are required
- Coordinate with the city, municipality and health facility that will be involved in the emergency response.

- Request all vaccine storage facilities to update their inventory records in order to determine the available storage capacity for vaccines and immunization supplies.
- Arrange transport vehicles for the vaccination teams.If the vaccine storage capacity requirements are not sufficient, then request for additional cold chain equipment.
- Determine whether you have enough staff to administer the vaccines and if vehicles are required.
- Prepare the action plan and discuss with supervisor.

5. Stock-out of vaccines

Scenario 5:

A provincial vaccine storage facility has a recurring stock-out problem for routine EPI vaccines. This problem is replicated in the two health centers served by the province.

Recommended actions:

- Province should review the vaccines and immunization supplies annual quantity requirements for the province and health centers using the most recent and realistic wastage factor.
- Always conduct a physical count of vaccines and immunization supplies to find out any discrepancy from the stock inventory record.
- Calculate required vaccine to cover children missed during the stockout including current need and send request for vaccine supply.
- Monitor releases of vaccines and immunization supplies to the health centers. These should not exceed the total annual quantity requirements.
- Remember that vaccines are always higher in quantity than the AD syringes because of the vaccine wastage factor.
- Vaccine wastage should be regularly monitored and actions have to be implemented to reduce or avoid vaccine wastage.
- Always adhere to the four criteria of the MDVP.
- Investigate cause of stock out and avoid future repeat of the incidence.

6. Flooding

Scenario 6:

An announcement was made that a typhoon is coming and heavy rains is expected that will cause flooding in the area including the health facility.

Recommended actions when flooding is forecasted:

- Be alert by monitoring your surroundings.
- Monitor radio or local television broadcast.
- Seal vents, drainage or opening to prevent flooding.
- If flash flood warning is issued for your area:
  - Health worker should prepare sufficient cold box or vaccine carrier to contain all the vaccines and diluents.
  - Pack vaccines in cold box or vaccine carrier with conditioned ice-packs and take them to a safe area. Empty the refrigerator.
  - Pack all the immunization supplies in a waterproof container and identify a room on the upper level to use for temporary storage.
- Switch off the refrigerator, disconnect the power cord and shut off the circuit breakers.
- Identify one room on the upper level (if available) for the temporary shelter of the vaccine refrigerator.
- If possible move the refrigerator to a higher ground and not prone to flooding.
- If it is not possible to move the refrigerator, after switching off the unit, wrap with plastic the entire compressor particularly the compressor electrical terminals and wirings.
- Secure the refrigerator by locking the doors and windows.

Recommended actions during a flood:

- If the flood comes all of a sudden without warning, shut off the electricity at the circuit breaker.
- If the rising water is still not risky, collect all the vaccines from the refrigerator and placed in a cold box or vaccine carrier and move to safe ground.
- If the water is rising quickly and if you think you are at risk evacuate immediately, save yourself and leave the vaccines in the refrigerator.
- Get out of low areas that may be subject to flooding and go to higher ground as quick as possible.

Recommended actions after a flood:

- Monitor weather broadcast on radio and television.
- Wait until authorities indicate it is safe to return to flooded area.
- If the building was flooded, check for structural damage, inspect foundations for cracks.
- Do not enter the building that has flooded until local building official have inspected it for safety.
- Examine walls, floors, doors, windows and ceilings for risk of collapsing.Keep windows and doors open for ventilation to remove foul odors.Have an electrician check the electrical system.
- Dry both the inside and outside surfaces of the vaccine refrigerator.
- Have a refrigerator technician check the electrical system of the vaccine refrigerator to ensure that the refrigerator is safe to operate.
- Run the refrigerator for at least four hours and monitor its storage temperature.
- Inspect the VVM of the vaccines loaded in the cold box or vaccine carriers.
- When the storage temperature is maintained at +2°C to +8°C for at least four hours, load the vaccines with VVM at stage 1 and stage 2.
